Internal Combustion Marine Engines.—A number of hints to Canadian manufacturers are contained in reports received this week by the Trade and Commerce Department from its commissioners in different lands. Why Canada is losing the New Zealand trade in internal combustion marine engines is pointed out by Commissioner W. A. Beddoe from New Zealand. The high price, ancient standard and inapt construction of the Canadian engines is given as the cause. Canada has a big advantage over the United States in the matter of tariff, yet the American engine is landed cheaper than the Canadian one, and another objection to the latter is that it is too heavy in construction.

DEVELOPMENTS IN MACHINERY

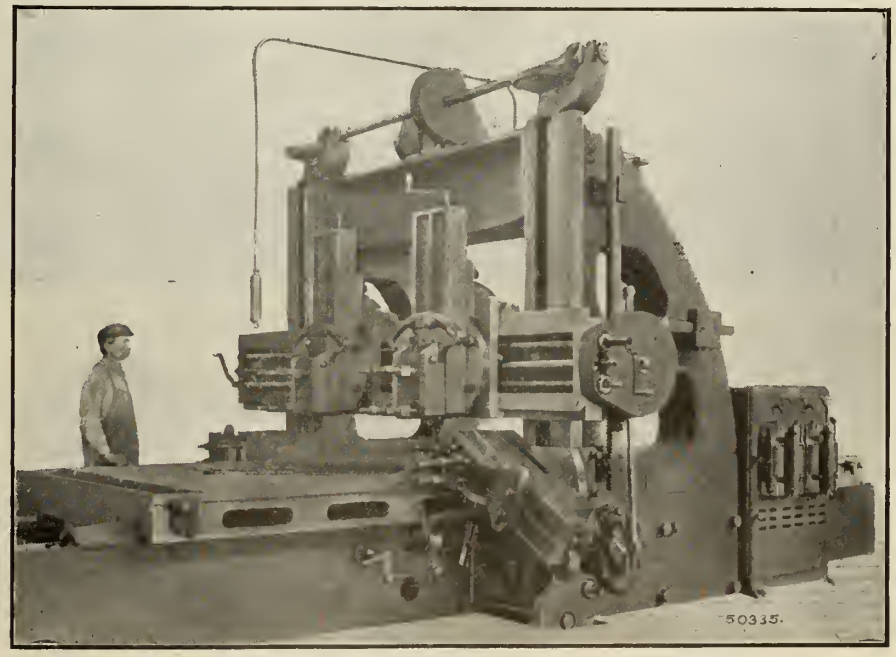
A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

NEW RAIL DRILLING MACHINE.

THE rail drilling machine shown in the illustration possesses some new and interesting features. The three holes for the fish-plate bolts and the

NEWTON RAIL-DRILLING MACHINE.

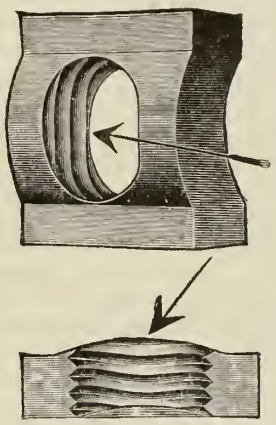
hole for the rail bond are all drilled at the same time. The three right-hand spindles are for the bolt holes, and these are arranged so that the distance between centres of the holes can be adjusted from 3½ to 9 inches. The left-hand spindle is for the rail-bond hole; it keeps a constant distance of 6 inches from the last bolt hole. All the spindles are mounted on a saddle and can be moved vertically in unison. The saddle is counter-weighted and has two changes of power feed in addition to hand adjustment. The machine is made by the Newton Machine Tool Works, Philadelphia, and a 10-h.p. Westinghouse electric direct current motor furnishes the power.



POND PLANERS AT COMMONWEALTH STEEL CO. PLANT.

POND heavy planers for work 120 in. wide and 72 in. high, 96 in. wide and 72 in. high, 86 in. wide and 48 in. high, all to plane 18 ft. long, and each constructed with two heads on cross-rail and one side head on each upright, have recently been built for the Commonwealth Steel Co., of St. Louis, at the Pond Works, of Niles-Bement-Pond Co. These planers are constructed for severest duty on steel castings, requiring the strongest, heaviest and most accurate construction. All gears are steel castings or steel forgings and all bearings are bronze lined with ample provision for lubrication. All the gearing, shafts and bearings are of heavy, substantial construction, and all wearing surfaces are proportioned for long and efficient service.

The illustration shows one of the 86 in. wide by 48 in. high by 18 ft. long planers. This is one of 29 planers used by the Commonwealth Steel Co., for machining the open hearth cast steel combined double body bolsters and platforms, which enter into the underframe construction for passenger cars, and are used also in machining the steel truck frames for both four and six-wheel trucks for passenger cars, locomotives and locomotive tenders, as well as the one-piece tender underframe. All these large steel castings require considerable machining to assure accuracy in attaching the sills and upper structure of the car body, and absolute squareness of both car body and truck frames—a very important consideration in the construction of passenger cars and locomotives.

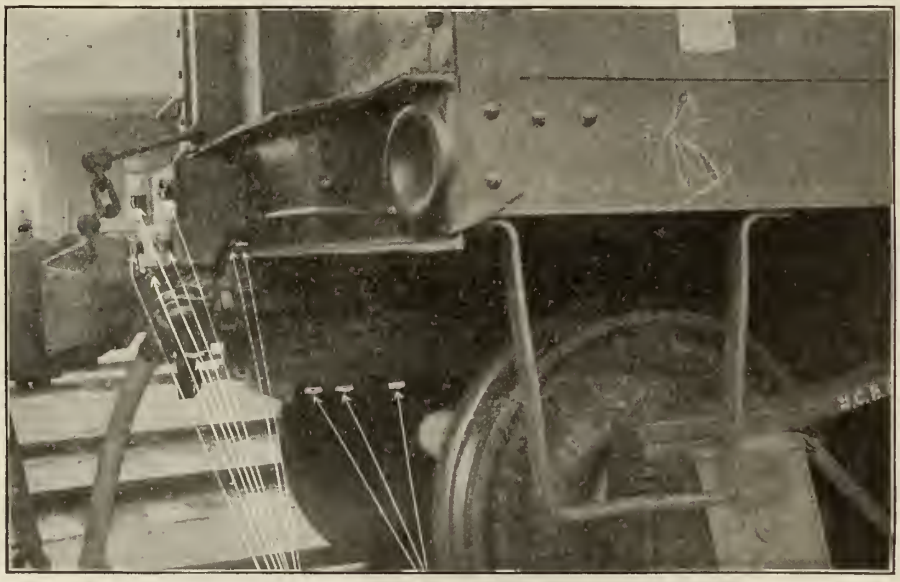


The planer illustrated is 88 in. wide between uprights, takes 50 in. between table and crossrail, and planes 18 ft. long, the table being 80 in. wide and 20 ft. long overall. The drive is by a 50 h.p. reversing motor of Niles-Bement-Pond Co., patented system, directly connected to the gearing. The speed of the table is instantly adjustable, without stopping, by hand wheels conveniently located on the controller. The limits are 25 ft. and 50 ft. per minute for the cutting stroke, and between 50 ft. and 90 ft. per minute for the return stroke. The driving motor is directly connected to the first driving shaft at the back of the planer quite out of the way of the operator. The controller, resistance, pilot switch and circuit breaker are mounted in a ventilated cabinet which also contains all wiring except the wires from controller to motor which are carried across the planer bed in metal conduit.

Operating levers on front and back of bed are connected to the reversing switch, and may be operated by hand or automatically by adjustable dogs on the table. At the instant of reversal, the motor, through proper connections in controller, is disconnected from the line and becomes a powerful dynamic brake, stopping the table at once without taking current from the line, while a patented pendant switch carried by a swiveling bracket mounted on the arch, may be moved by the operator to any convenient position, thereby giving him control of the driving motor for starting, stopping or reversing the table, if the work requires him to be in such location that he cannot reach either of the

"POND" HEAVY PLANER, 86 IN. X 48 IN. X 18 FT.

GRIP NUTS



This cut shows an exaggerated curve in thread pitch in order to emphasize this feature, or more than is given in practice.

Why Grip Nuts Lock

Each bar of steel has an arch running through the centre of it. The nut is first blanked out and threaded through this arch, after which it is accurately gauged, then deflected by pressure upon the crown of the arch by automatic machinery as shown in this illustration.

Grip Holding Nuts

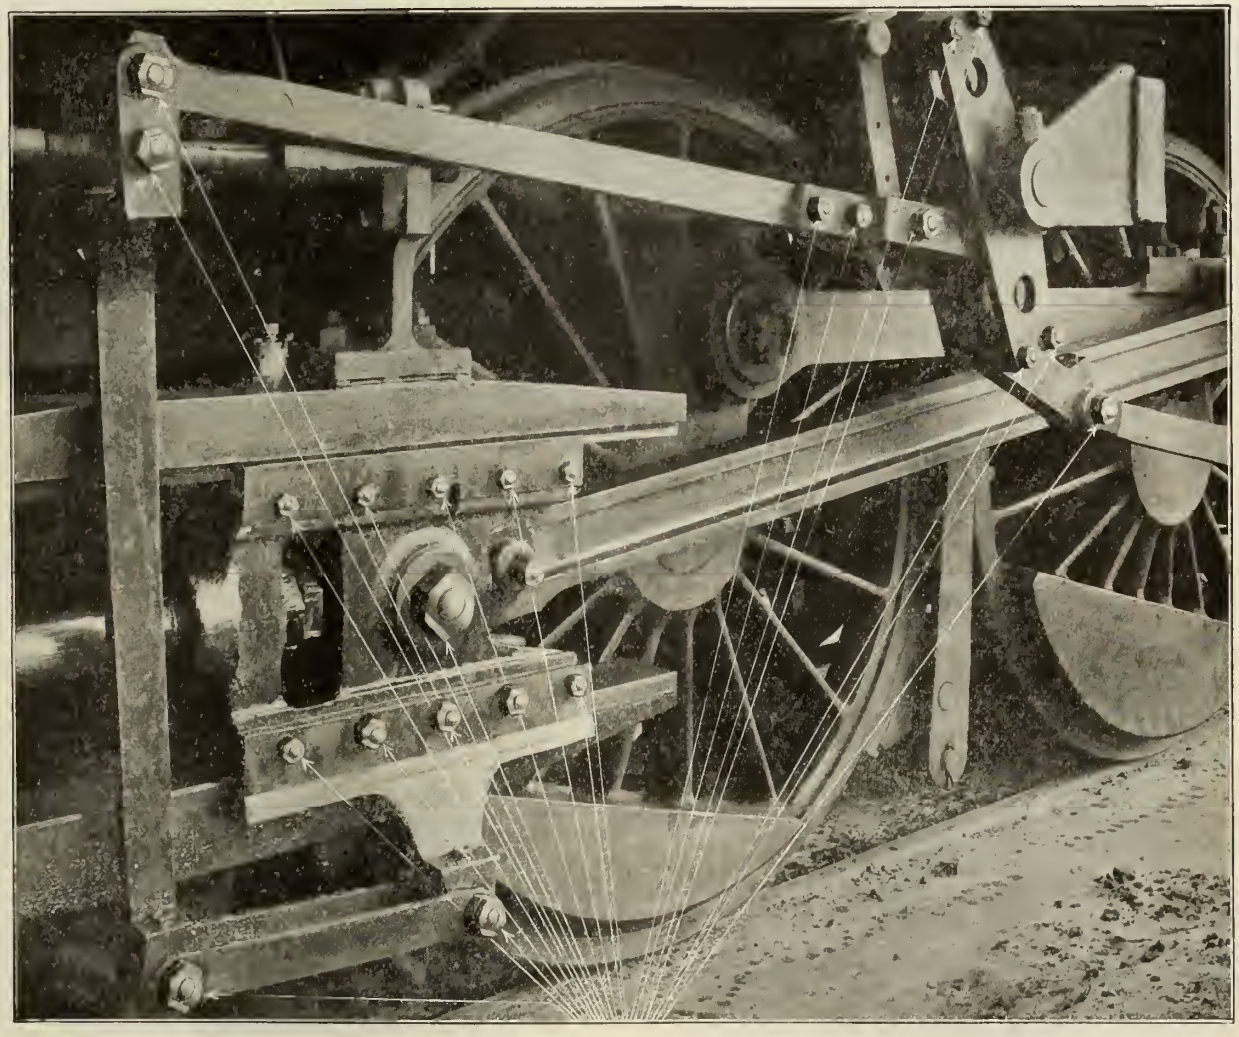
Grip Holding Nuts are made of heavier steel than the Grip Lock or check nuts, and have 94 per cent. of the ultimate strength of the bolts. Made in all sizes. Hexagon and Square, and are used where a single nut only is required, furnishing both holding and locking features.

Standard Steel Frame Box Car

Showing a section of the car equipped with **Grip Nuts.** This portion of the car is one of the most important places where lock nuts are required.

GRIP NUTS

The vise-like grip obtained on the threads of the bolts by the application of Grip Nuts secures a result different from that of any other locking device, for the reason that it resists equally in both directions, and is entirely independent of anything but the bolt for its locking action. The Grip Nut does not injure the threads of the bolt, and can be applied and re-applied.



SAMPLE NUTS SUPPLIED ON REQUEST.

CANADA GRIP NUT COMPANY, LIMITED

Head Office : MONTREAL, OUE., 803 Eastern Townships Bank Bldg., 263 St. James St. Works, ST. JOHN'S, QUE.

The advertiser would like to know where you saw his advertisement—tell him.

SAFETY  FIRST

GRIP NUTS

This Picture was taken 14 months after the Grip Nuts were applied. The report is that not a nut was loose; the test was entirely satisfactory, and that Grip Nuts will be generally used as the result of this test. The test was instituted and conducted by an official of the mechanical department of a leading railroad, whose name will be furnished to proper parties by permission. We will cheerfully furnish sample nuts. Send us diameter of bolt.

The advertiser would like to know where you saw his advertisement—tell him.

levers on the front and back sides of the bed.

To prevent the table running off the gearing, or breakage of tools or planer caused by failure of line current or overload, a patent circuit breaker is provided which will stop the motor at once by dynamic braking. The crossrail is raised and lowered by an independent reversible motor mounted on the arch.

AUTOMATIC DIE COPYING MACHINE.

THE machine here illustrated is one that has recently been developed by the firm of Alfred H. Schutte, Cologne, Germany, for automatically cutting blanking and forming dies by the copying principle. It is adapted for the manufacture of all kinds of stamping dies, such as are used in making automobile and bicycle parts, carriage mountings, etc., as well as for making heading and forging dies for bolt and drop-forging machines. By the use of this machine dies of any shape are copied automatically from a templet.

In order to partly eliminate costly manual labor, fret saws and filing machines are sometimes used, though there are many shops which rely entirely on hand labor. Fret saw and filing machines, however, can only be satisfactorily operated by fairly experienced men, considerable skill being required to turn out first-class work. Furthermore, the expense for new saws and files is considerable, and a die made by such methods can rarely be used without further finishing by hand work.

The advantage of the machine here illustrated is that it is fully automatic. After the opening in the die block has been roughed out on a drill press, the block and templet are clamped to the table of the machine, a piece of plate about ⅛ inch thick being inserted between them. Thereafter the action of the machine is entirely automatic, enabling one operator to attend to several machines, and largely dispensing with highly-paid die-makers. The operation of the machine is similar to that of a draw-stroke keyseater, with the addition of a self-acting copying motion, which results in an exact reproduction of the templet.

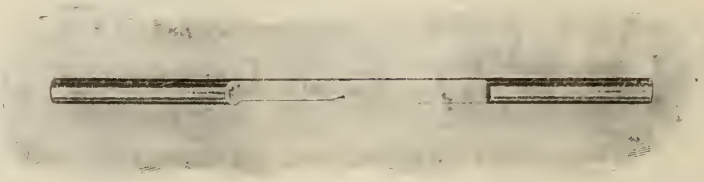

FIG. 3. THE CUTTING TOOL.

FIG. 4. SPECIMEN OF DIES CUT ON THE MACHINE.

The cutting tool, seen in Fig. 3, is triangular in section, and is backed off just below the middle to form a cutting point. The top part of the tool projects a little, serving as a guide, which follows the contour of the templet, no matter

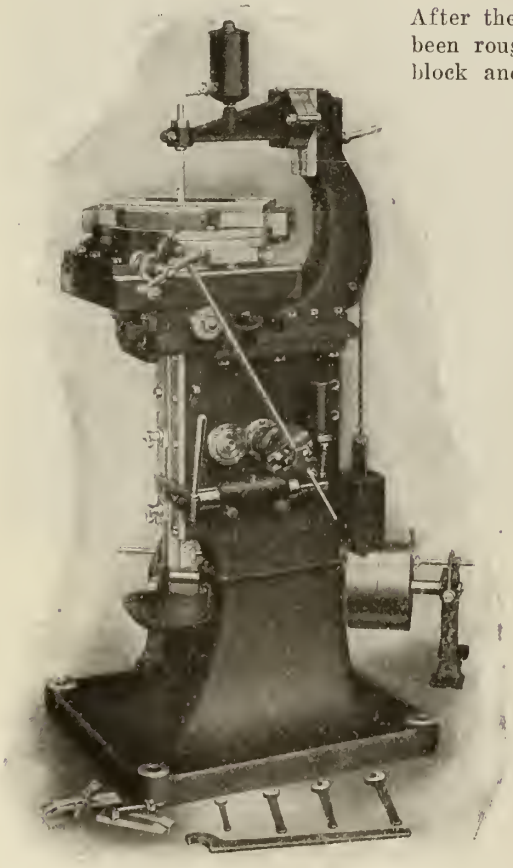

FIG. 1. AUTOMATIC DIE COPYING MACHINE.

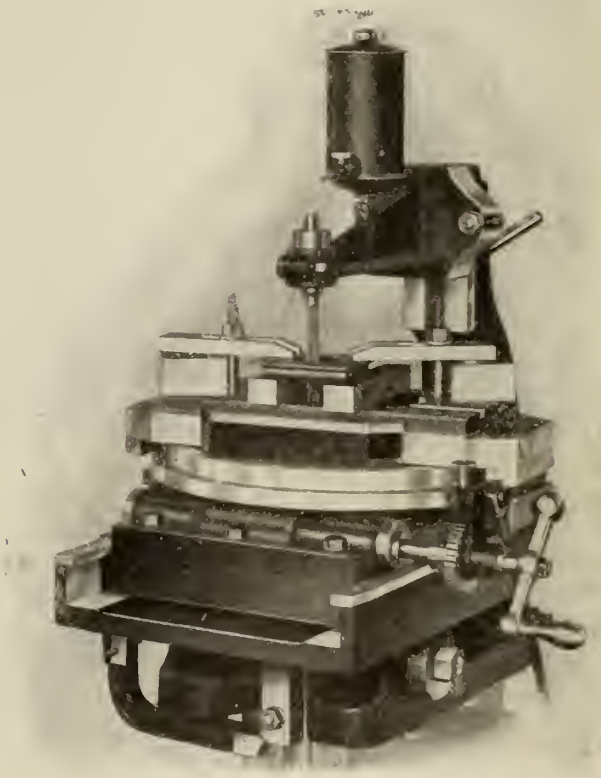

FIG. 2. VIEW OF TABLE, WITH WORK AND TEMPLET CLAMPED IN PLACE.

how irregular the latter may be. Naturally, the more pronounced the off-set is, the deeper the cut.

During the upward stroke of the ram the table, together with the work and templet, is pulled towards the tool by the counterweight seen in Fig. 1, and at the same time is moved through the amount of the feed set. When the ram has reached its highest position the table is automatically locked and the tool cuts. At the end of the stroke the table is

FIG. 5. NUT DIE CUT ON THE MACHINE.

automatically released and the same operation is repeated. Material is removed at full stroke until the inside edge of the templet and the upper edge of the tool are in proximity. When the upper edge of the tool comes in contact with the templet, cutting ceases.

For giving clearance to the die the table can be tilted, a graduated scale being provided for the adjustment. In the case of dies that require no clearance, several can be finished at one setting up to a total thickness of 3⅛ inches. The standard equipment of the machine allows of copying dies up to 7½ inches cutting length, or up to 15 inches by re-setting. For very long dies an extra

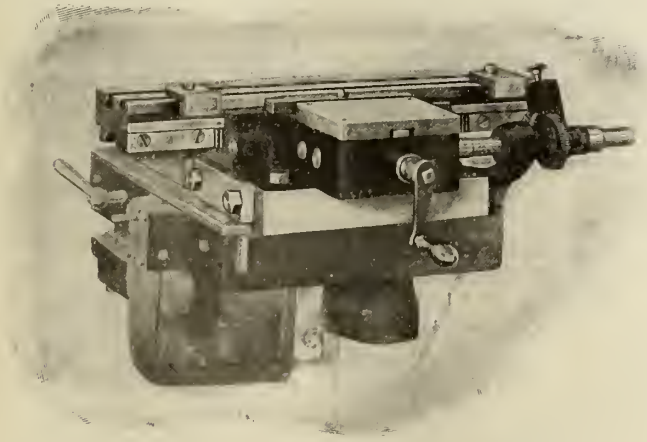

FIG. 6. SPECIAL ATTACHMENT FOR LONG DIES.

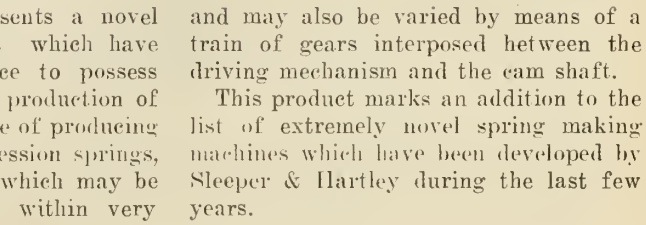
attachment, shown in Fig. 6, can be furnished, and by means of this dies up to 12 inches cutting length can be formed without re-setting.

Besides the reduction in the cost of output, another advantage claimed for this machine is that all dies made from the same templet are absolutely uniform, a condition very difficult to achieve by hand work. The die is an accurate copy of the templet, has sharp edges, and in most cases can be hardened and used directly it comes from the machine, no further finishing being required.

In Fig. 4 are seen three dies, ⅝-inch thick, just as they came from the machine. The cutting time on these was 45 minutes each. The centre die is of special interest on account of the intricacy of its outline. Fig. 5 shows a nut die, 1½-inch deep, two of which have been finished at one operation in 30 minutes. A die for a bicycle pedal is shown in Fig. 7. This was finished in nine minutes, including the time taken to re-set it three times. No hand work was necessary on any of these dies, and they were hardened immediately after leaving the machine.

The floor space required by the machine is approximately 26 x 26 inches, and the shipping weight is about 1,325 lbs.

The Canadian agents for Alfred Schutte are Messrs. Kauert & Doehler, 35 St. Nicholas Street, Montreal, who report that, after making an experimental purchase of one machine, the German General Electric Company have recently placed a further order for fourteen.



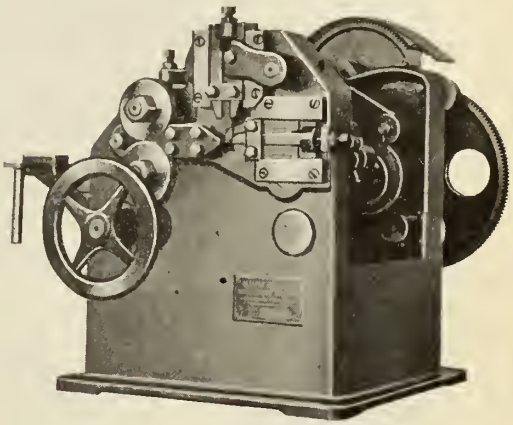


FIG. 7. BICYCLE PEDAL DIE.

other. The design represents a novel combination of elements which have been found by experience to possess marked advantages in the production of spring forms. It is capable of producing either extension or compression springs, and the length of spring which may be produced can be varied within very wide limits. These machines may be adapted either for continuous coiling, or they may be equipped with cutting devices for intermittent coiling and cutting to pre-determined lengths. In addition, they may be equipped with pitch tools of an adjustable type, and also with a diameter-varying attachment, by means of which either extension or com-

SPECIAL SPRING COILING MACHINE.

pression springs may be produced in coned or barrel forms of various kinds.

The machines comprise in their most complex forms all the necessary means for making a wide range of springs, either extension or compression, and are built in the following sizes:—

No. 00, handling wire up to .015 in. diameter.

No. 0, handling wire from No. 32 to No. 20.

No. 1, handling wire from No. 24 to No. 14.

No. 2, handling wire from No. 16 to No. 6.

No. 3, handling wire from No. 6 to ⅜ inch.

The feed may be varied within wide limits by means of the cam equipment, and may also be varied by means of a train of gears interposed between the driving mechanism and the cam shaft.

This product marks an addition to the list of extremely novel spring making machines which have been developed by Sleeper & Hartley during the last few years.

SPECIAL SPRING COILING MACHINE.

THE machine illustrated is a new type of spring coiler which has been developed recently by Sleeper & Hartley, of Worcester, Mass., and Coaticook, P.Q. It is especially intended for the spring maker on the one hand, and for industrial establishments on the

PRACTICAL ENCOURAGEMENT OF ECONOMY.

THE secrecy maintained by many and especially large manufacturing concerns regarding costs of material and operation may have its useful ends, but it also has drawbacks. A little judicious confidence with the men interested in these matters cannot but do considerable good.

The store-keeper should know the value of the materials which he has to hand out, for with him economy should begin. If the machine man knew the cost of high speed steel, oil cans, etc.; if the oiler knew the value of waste and the comparative costs of lubricants, and if the sweepers and truckmen were given a knowledge of the scrap value of remnant and worn out materials, the interest aroused would result in a large saving for the company of what otherwise goes to waste.

True it is that some few might make improper use of such information, but, as the average workman is brought up to practise economy in his home, his saving propensities will, no doubt, predominate over any tendency to extravagance or dishonesty.

PROTECT THOSE SET-SCREWS.

ONCE more the projecting set-screw has been the cause of a fatal accident. On April 21, a painter was at work on the ceiling of a laundry in Charlottetown, P.E.I., when the sleeve of his coat got caught by a set-screw projecting from a line shaft. He was whirled round the shaft several times before the machinery could be stopped, his body being forced each time through a space of 18 inches between the shaft and the ceiling. Both legs were badly broken and he received other serious injuries, which resulted in his death six hours after the accident. Is it not about time that the use of projecting set screws should be absolutely prohibited by law unless they are fully guarded by safety collars?

EDUCATING THE MECHANIC.

A RECENT speech of Dr. F. W. Merchant, M.A., before the college and high school department of the Ontario Educational Association, contained a brief and comprehensive description of the status of vocational training in Ontario, as well as some valuable, though modest, remedial suggestions.

The necessity of trade schools is the result of the rapidly changing systems of manufacture. The old methods provided facilities for many apprentices, but today, the tendency of specialization, in even the smallest elements of the metal trades in particular, renders it almost impossible for a boy to become a well-rounded craftsman. Very few of our manufacturing institutions have any apprentice system whatever. One Ontario plant employing over 2,000 men has not had an apprentice in twelve years.

Even if the shops did furnish the requisite number of young men with practical training, it is certain that our public schools do not supply the groundwork by a suitable mathematical and executive education. The fact that many of our most successful men left school before the age of fourteen, shows that a large part of the education received beyond this is more or less superfluous.

The scope of the technical schools in Ontario is such that they would provide training for less than two per cent. of the school boys of the province. What there is deals very largely with wood working, while the fundamental and nationally important trades, those contiguous to the iron and steel industries, are sadly neglected.

The first step is obviously to provide a sufficient elementary mathematical education to enable the student to enter a trade upon graduating from the high school with only the practical side of the business to master. If the young mechanic wish it, a thorough technical school training in his chosen vocation should now be open to him. If, however, lack of time or funds prevent this, the technical training available at night schools should be such that, when coupled with his shop work, he would have the opportunity of making of himself a first-class, reliant and aggressive tradesman.

INDUSTRIAL NOTABILITIES--No. 32

MAXIMILIAN EUGENE DUNCAN was born March 28th, 1862, in New York City, a son of Maurice and Caesarine (De Villars) Duncan. The father was a native American, of Scotch and German descent, while the mother was born in France, a descendant of the historical De Villars family.

He received his education, or rather his schooling in New York City, as he became a messenger boy at the early age of thirteen. He was next employed in the manufacturing department of the Pullman Co., and from there he went to a Car Company at Jeffersonville, Ind. This company was subsequently absorbed by, and now forms one of the constituents of the American Car & Foundry Co.

MAXIMILIAN EUGENE DUNCAN.

When this consolidation took place Mr. Duncan went with the new corporation in 1899, and remained with them until 1912, occupying the office of General Sales Agent.

He is vice-president, general manager and director of the Canadian Car & Foundry Co., of Montreal; a member of the St. Louis and of the Noon-day Clubs of St. Louis, Mo.; a member of St. James and Mount Royal Club, Montreal, and Beaconsfield Country Club.

Mr. Duncan married Lillian Louise Gorby, of Alabama, daughter of the celebrated geologist, Sylvester S. Gorby, the union bringing two children. Mary Dean Duncan, born in 1892, and Maurice Eugene Duncan, born in 1897.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., April 27, 1914.—It is somewhat disappointing to have to report that the improvement noticeable last week has hardly been maintained. Perhaps the improved conditions were more apparent than real and the pronounced optimism the result of the placing of two substantial orders that week. This time last year brokers were doing a flourishing business in "pick-up" orders for single machines, often booking three and four such orders a day. Now, they are thankful for one or two a week.

Norton, Griffiths & Co., Ltd., St. John, N.B., are erecting a new machine shop at Courtenay Bay, in connection with their government contract. This shop will take care of repairs to equipment and will be fitted out with modern machine tools, mostly of a heavy character. Tenders for these are now being submitted by all the leading houses, and some keen competition may be looked for.

There is a fair trade being done in boiler and tank plates, and an improvement is looked for from now on, owing to navigation being again open. Speculation is rife as to what decision has been reached by the Government with regard to the Canadian Northern bond guarantee. An announcement is expected this week. Rumor says that the plan provides for the consolidation of C. N. R. subsidiary companies with the parent system and practically government control of a majority of the common stock. This would be the security the C. N. R. would have to give for the bond guarantee it is seeking. This bond guarantee, it is said, will amount to about half of the sum needed to complete the road and the company will have to finance the remainder itself. If this scheme goes through, it will probably mean a great deal to Montreal, as it is anticipated that the C. N. R. will place a large order for locomotives and cars, which local firms will make strenuous efforts to obtain.

The Canadian Vickers Co. state that the keel of the ice breaker which they are to build for the government will be laid at their Maisonneuve yards some time next month, and it is fully expected that this will inaugurate a long and prosperous career for this ship-building plant.

Navigation on the St. Lawrence is now open. All buoys have been placed and the first ocean boat is due at Quebec to-morrow, and at Montreal on Wednesday, the 29th inst. The local ferries to Longueuil and Boucherville have been running for several days.

The metal market is still quiet, though copper and lead both show a firmer tendency. The Mexican situation has not yet had any influence locally on the price of lead, but dealers are watching the situation closely.

Toronto, Ont., April 28, 1914.—Industrial conditions appear to be marking time, no improvement being noticeable this week. The advent of more seasonable climatic conditions should stimulate business generally, especially the building trade; signs are wanting, however, of much activity in this connection at present. The Mexican trouble has assumed a more unfavorable aspect, and will indirectly affect this country, through the money market. Those holding Mexican securities will be glad when order is restored again. The opening of navigation on the Great Lakes has already had the effect of producing a scene of greater activity on the water front. The Toronto Street Railway Co. has inaugurated a "Safety First" campaign similar to one which has already been promoted by the Montreal Tramways Co. This is further evidence of a desire on the part of public companies to safeguard both the public and their employees.

It is hoped that a start will soon be made on the much-talked-of new Union Station. The plans have been presented by the railway companies interested to the Dominion Railway Board for approval, and the representatives of the city will now pass upon them. It is expected that a decision will be arrived at early in May, and the work commenced as soon as possible thereafter. The plans call for a fine structure, and incidentally a much needed one. There have been several local companies incorporated recently, the most important being the Dominion Engineering and Machinery Co., Ltd., which has taken over the Ontario Wind Engine and Pump Co., and proposes to make considerable extensions to the plant.

The steel market is quiet, and everything points to a continuance of this condition. We understand that the mills have, in some cases, been making an effort to raise their prices on certain lines, but we do not believe that any business was done at the increased rate. It is extremely doubtful that better prices will be obtained under the conditions now prevailing. Reports from the United States indicate that the steel works are operating at a further reduced tonnage, the output being less than earlier in the month. It has been reported that the United States Steel Corporation will begin, shortly, the construction of a wire rod mill at Ojibway, Ont., and it is rather doubtful if anything further will be done in this direction this year. We understand that the structural mill which the above company propose establishing there depends to a large extent upon the Dominion Government agreeing to increase the duty on rolled shapes to double the present rate. If the guarantee is forthcoming, the financing of this project will be easy to accomplish.

The pig iron market shows no improvement, and is still very quiet. Prices remain the same, although there are indications that a slight reduction may be made unless conditions improve materially.

Dealers in machine tools report business as being quiet, with few inquiries in view. One firm report having had a good week, the orders booked embracing several grinders, hack saw machines and drills for the Trussed Steel Concrete Co., Walkerville, Ont., and a 24-in. "Stockbridge" shaper for the Canadian Metal Products Co., Galt, Ont.

The metal market is quiet, little change having taken place during the week. Prices rule the same, with the exception of tin, which is being quoted in London, England, at an advance of £3 per ton, which is equivalent to 5/8 cents per pound. Dealers report a scarcity of lead.

CANADA'S TRADE WITH BRITAIN.

THE following are the official figures of trade between Great Britain and Canada during March:

From Canada:	1914.	1913.
Wheat	£516,697	£395,001
Wheat meal and flour	189,105	170,899
Barley	20,082	48,925
Oats	2,798	13,091
Bacon	63,670	92,320
Hams	25,052	28,289
Cheese	850	87,588
Canned Salmon	236,249	21,294
To Canada:	**1914.**	**1913.**
Spirits	£53,662	£40,125
Wool	6,355	13,568
Pig iron	4,037	6,459
Wrought bars	3,372	7,189
New rails	110	60
Galvanized sheets	20,819	30,262
Tinned plates	4,887	8,208
Steel bars, etc.	6,282	31,888
Pig lead	4,168	8,138

CANADIAN TRADE RECORD.

THE total trade of Canada during the year just closed reached the splendid total of $1,112,562,107, an increase of $44,000,000 over the total of the previous year.

Domestic exports during the year amounted to $431,589,658, as against $355,754,604 for the previous fiscal year; a gain of $75,835,058.

Imports declined during the year by $41,868,989, the total for the year being $633,564,179, as against $675,428,168 for 1913. During the last month of the fiscal year the imports amounted to $67,904,336, an increase of $13,384,107. Exports showed a decrease, the total for the month being $26,701,026, compared with $34,874,752 for the corresponding month of the previous fiscal year.

The total trade for March was $92,887,053, a decrease of $13,261,199. An increase of $8,500,000 is shown in the exports of domestic animals and their produce, the total under this head being for the year $53,349,119.

Exports of domestic manufactures also increased, the gain in this case being $13,750,000 on a total of $57,443,452. Exports under the head of agriculture increased $48,000,000, the totals being for 1913, $150,545,661, and for 1914, $198,220,029.

WESTERN CANADA POWER CO.

THE revenue of the Western Canada Power Co. for the year ended December 31 last fell considerably below estimates, the reasons for this given in the annual report, which was mailed to shareholders on April 27, being, first, unavoidable delays in getting the B. C. Electric Railway contract into working order; and, secondly, the general depression in industrial business, which caused a large proportion of the motors connected to the company's mines to be idle.

"The financial depression of 1913," says Mr. C. H. Cahn, the president, "undoubtedly set back the company's earnings from twelve to eighteen months, and the first three months of 1914 have shown poor returns on account of the shutting down of mills in January for the overhauling which occurs every year, but which was more general this year than usual. Already, however, the mills are beginning to start again, and there are indications from all sides that business will soon regain normal conditions. With so many large motors already connected to the company's mains, revenues for industrial power will increase very rapidly when the mills commence to run again.

"The company is still treated as being in the construction stage, a balance sheet is presented, but no profit and loss account is shown. As to this, the auditors remark that as the undertaking of the company is not yet completed and in full operation, by resolution of the board of directors, interest on bonds to date has been charged to construction account, and the revenues received from the sales of electric energy, in excess of operating expenses have been credited to the same account."

The operating profit is not given, but in the course of the annual report it is stated that in the twelve months ending December 31, 48,196,000 kilowatt hours were sold and realized a revenue of $293,697. Against this it was estimated a year ago that net earnings available for bond interest would be $375,000.

Contracts for two 9,000 kilowatt units in addition to the two put in commission on January 1st, 1912, were placed last year. One of the new units will be installed this summer and the other in 1915. The ultimate capacity when the four units have been installed will be 52,000 horse-power. Future developments aim at an ultimate capacity of 140,000 horse-power.

Dealing with the B. C. Electric Railway contract, it is stated that the company is now taking between 6,000 and 8,000 horse-power, and will probably take from 10,000 to 12,000 horse-power after September 1, 1914. Western Canada Power has also made a contract with the Puget Sound Traction, Light and Power Co. for the supply of 66,000 horse-power, and the company is now taking the full amount.

AFFAIRS AT PORT NELSON.

M. J. JENKINS and James H. Burke, young Canadians, arrived in Winnipeg over the frozen trails from Port Nelson, and they have been quoted as confirming previous reports of disaster and misfortune to Government boats and stores.

A total of 126 men spent the winter at Port Nelson in the employ of the Government, they say. The steamer Ceranze is still stranded on the rocks ten miles out from the coast, and the steamer Allette is beached five miles up the Nelson River. The men say no watch was kept on the Alletta, which has been looted of fixings and equipment. They estimate the cost to the Government through the loss of boats at $500,000.

Jenkins and Burke state further that the new dredge Port Nelson, built in Toronto, is in bad shape. It was beached in the river, but carried on to the rocks by wind and tide. It cannot be used until repaired in dry dock, and there is no dry dock in the north.

They find fault with the sanitary conditions at Port Nelson, and assert the housing conditions were so bad that mounted police ordered the bunk-houses cleaned out.

They tell how Arthur Sinclair, a half-breed Indian, traveled 65 miles through the snow in the most extreme weather to Port Nelson in order to bring help to two companions who were forced through frozen feet to camp on the trail and wait for succor.

MANGANESE STEEL RAILWAY MATERIAL.

IN a recent paper by Sir Robert Hadfield, presented at a New York meeting of the American Institute of Mining Engineers, the author traced the history of manganese steel railway material during the last twenty years. He said that, although at the beginning of that period there was no difficulty in

making and producing manganese steel in various forms, rolled or pressed, on account of its higher expense, sufficient encouragement was not then obtained from the users to introduce these products on a large scale. The matter was further pursued in the present decade.

In 1904, a French manufacturer produced light manganese steel rails, tests of which were so satisfactory that heavy sections of 100 lb. per yard were then made in the same rolling mill. A large number of these rails were rolled in 1907, and were supplied to the Metropolitan Electric Railway of Paris, and put to work among other places at the Bastile Station in that city. These rails, during several years of service on severe curve work, had given great satisfaction. After three years' hard service, the actual wear was found to be not more than about 2½ mm. It had been estimated that the rails would remain in service for six to seven years before being worn out, whereas ordinary steel rails wore out and had to be replaced in less than a year.

Under the system devised by the writer no less than 90 per cent. of sound ingots was obtained from an alloy steel. Each 1 per cent. of expensive material saved meant that much reduction in the cost of production. The consumer had now to pay for 15, 20 or even 30 per cent. of waste in special steels made in the ordinary way, whereas this waste could to a large extent be avoided.

OBSERVATIONS ON BUSINESS FATIGUE.

IN the course of an address made before the Western Efficiency Society, on February 27, in discussing the problem of human efficiency with special reference to the industries, Herbert L. Trube, Indestructo Company, Mishawaka, Ind., made the following observations on the subject of fatigue:—

Those conditions which hinder attention have the direct effect of decreasing the product of labor. Both the feelings of monotony and fatigue are two such conditions, and, therefore, for high efficiency should be avoided. Primarily, fatigue is due to continued application to an activity without adequate relaxation. Secondarily, it results from the conscious or unconscious effort expended in overcoming distractions. I believe the greater part of the fatigue which is developed in our factories and offices is due to the fact that in striving to give full attention to the work in hand the individual wastes his much needed energy in resisting interferences.

The modern business man is exhausted no more by his actual achievements than by the things which he is compelled to resist doing. Appeals for his attention are ceaseless. The roar of the street, the ring of the telephone, the din of typewriters, the sight of a row of men waiting for an interview, the audible conferences of neighboring office men, the plan for the day's work which is delayed, the anxiety for the results of certain endeavors, suspicion as to the loyalty of employees—these and a score of other distractions are constantly bombarding him.

In a similar way, the workman in the shop resists the distractions of unnecessary noises, unnecessary conversations, unnecessary sights, etc. Walter Dill Scott, professor of psychology, North-Western University, says in substance, "As any source of light gives off equally in all directions, so the human intellect seems designed to absorb from all directions." To prevent waste of energy, therefore, all possible distractions should be removed, thus leaving the mind free to concentrate on the work in hand.

MESSAGE TO G.T.R. MEN.

EVERY employee of the Grand Trunk and Grand Trunk Pacific Railways last week received a circular from President E. J. Chamberlin, in which he demands the best possible service from railwaymen to their patrons.

"The ticket rates are alike for all," says the circular, "and any person buying a ticket, no matter what style his clothes, how much money he displays, or what his position in society, is entitled to proper and courteous treatment.

"The railroad man has a great opportunity for passing out kindness and goodwill. He comes in contact with every kind and condition of individual; the old, the young; the rich, the poor; the illiterate, the learned, the happy, the prosperous, and those in defeat. He knows to which class they belong. A smile, a kind word, or a kindness done to any of these cannot fail to leave its impression for good and this good cannot help but expand. Try it."

There is also a word as to freight shippers, saying that their needs and wishes should be anticipated as much as possible.

Dennis McGuire, a locomotive engineer on the Lehigh Valley Railroad, has been granted a month's leave with pay and an honor button for having brought forward a new "safety-first" idea. He suggested to Superintendent Charles Shea that engine inspectors be equipped with magnifying glasses, so that they might more readily detect cracks and flaws on axles and other mechanism. The suggestion was at once adopted, and McGuire received his reward.

BY-PRODUCT AND BEEHIVE COKE. OVEN YIELDS.

CANADA and the United States are far behind Germany and other foreign countries in realizing the economies resulting from the coking of coal in by-product ovens. In Germany, at the present time, little or no coke is made in retort (by-product) ovens.

When the economies which may be effected by the use of such ovens have been so clearly demonstrated, not only by plants which have been constructed in Europe, but also by plants at Sydney and Sault Ste. Marie in Canada, and in the United States, it is difficult to understand why they are not more generally adopted in Western Canada. No doubt the greater cost of installing them, and the lack of markets for the resultant by-products, have hindered progress in this direction in the past. The development of the West, however, is rapidly creating local markets for the products, and, in view of the higher yield, the greater initial cost should no longer be a deterrent.

Economies Effected.

The following are some of the economies which may be effected by the use of by-product coke ovens as against the use of beehive ovens:—

1.—The quality of the coke is just as good for metallurgical purposes as coke made in beehive ovens.

2.—The yield of coke from by-product ovens is from 10 to 15 per cent. higher than the yield from beehive ovens.

3.—While the cost of installation per oven is greater for the by-product than for the beehive oven, the capacity is from three to six times as great.

4.—In by-product ovens, the following by-products are saved:—

Gas.—Coke oven gas is an ideal fuel, and may be used for burning under boilers, driving gas engines, for domestic purposes and illumination.

Ammonia.—The ammonia may be recovered as ammonium sulphate or ammoniacal liquor. In the former case it is used as a fertilizer, while in the latter, it can be used for making many chemical products and also as the freezing agent for refrigeration purposes.

Tar.—The tar may be used in the manufacture of various kinds of roofing, for covering pipes, etc. It can be distilled, yielding pitch, creosote, light oils, carbolic acid, etc. Creosote is especially useful as a wood preservative. Pitch is used for road-making and as a binder for the manufacture of coal briquettes.

Fuller information on this important subject can be obtained by persons interested from a report entitled "Conservation of Coal in Canada," by W. J. Dick, M.Sc., recently published by the Commission of Conservation.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Redcliff, Alta.—The Redcliff Rolling Mills & Bolt Co., have recently installed new machinery.

Tillsonburg, Ont.— The municipal council has decided to purchase a new electric pump for the power house.

Welland, Ont.—It is announced that the Welland Machine & Foundries, Ltd., will erect a new foundry. The plans are completed and construction will begin shortly.

Sault Ste. Marie, Ont.—The Dominion Government have signed an agreement with the Lake Superior Dry Dock and Construction Co. for the construction of a dry dock here.

Prince Albert, Sask.—Plans for alterations to the sewage pumping station at a cost of $4,500, have been drawn. Pumps, valves, hydrants, meters, etc., will be required.

Sydney, C.B.—Renewed activity is indicated at the plant of the Dominion Iron and Steel Co., by the announcement that in a short space of time the company will blow-in another blast furnace.

Maisonneuve, Que.—The United Shoe Machinery Co. will erect a new factory at a cost of $300,000. The building will be two storeys high, 164 ft. by 140 ft, of brick construction. The general contractors are C. E. Deakin, Ltd.

Bridgeburg, Ont.—The plans for the new factory building of the International Register Co., of which D. H. and S. A. Waugh are the chief promoters, have just been completed, and contracts for construction will be let shortly.

Port Arthur, Ont.—John E. Conley, of Memphis, Tenn., president of the Conley Frog & Switch Works, is making preparations for the building of a frog and switch plant in the city. A bonus of $25,000 has been voted by the ratepayers for the factory.

Medicine Hat, Alta. — Gilbert Hunt and associates of Walla Walla, Wash., recently signed a contract with the town of Dauntless to build a big plant for the manufacture of threshing machines, feed grinders and other farm implements. This industry, which will be known as the Dominion Harvester Co., is the first of its kind in Western Canada. The plant will ultimately employ about 500 men and will represent an investment of $750,000. Construction is to start within two or three weeks.

Windsor, Ont.—The Canadian Zagelmeyer Co., has purchased a site of three acres in the factory district on Howard avenue. The plant will be devoted to the manufacture of moulds and machinery for Canadian and export trade. It will be a branch factory of the Zagelmeyer Machinery Co., in Bay City, Mich.

Niagara Falls, Ont. — The Dominion Chain Co. by-law to raise by debenture $12,000 to purchase a site for the company was carried here on April 23, seven to one, the vote being 932 for and 128 against. The company will erect a $95,000 plant, placing $90,000 worth of machinery therein, and will agree to employ 150 workmen.

New Westminster, B.C.—The Heaps Engineering Co., of this city, are calling tenders for the completion of the machine shop and foundry buildings, located on Lulu Island. These tenders are to be in by the end of this month, when the contract will be immediately awarded and work started. H. Schaake is general manager.

Electrical

Tavistock, Ont.—It is reported that a hydro-electric by-law will probably be submitted to the ratepayers.

Galt, Ont.—The last applicant for hydro service in this district is Wellesley Village, from which a fully signed petition has been sent to the commission.

Lake Megantic, Que.—Plans for the installation of a hydro-electric plant, at a cost of $150,000, have been accepted by the town council. Engineer E. A. Evans, Quebec.

Stouffville, Ont.—The proposed reconstruction of the wires, poles and outside equipment of the municipal electric light plant will be considered by the village council at their meeting next Monday.

Hamilton, Ont.—The Monarch Refillable Fuse Co. has been organized for the purpose of manufacturing electrical fuses. The fuses to be manufactured are the invention of Frank Kaiser, of Buffalo. As soon as a site has been chosen, a factory will be built.

Chatham, Ont.—Engineer Jeffrey, of the Hydro-Electric Commission has proposed to the city council that the city erect a power plant, at a cost of $89,000, and enter into competition with the Chatham Gas Co., which last month refused an offer of $410,000 for their gas and electric light plants. No action was taken.

Wallaceburg, Ont.—An offer was received by Mayor Dundas on April 23, from the Wallaceburg Gas Company, to sell the electrical end of its plant for $30,000, on condition that Hydro-Electric power is connected with its lines by Dec. 31 of this year. The offer will be submitted to the people, together with a by-law for $36,000 for equipment for the Hydro-Electric station.

Municipal

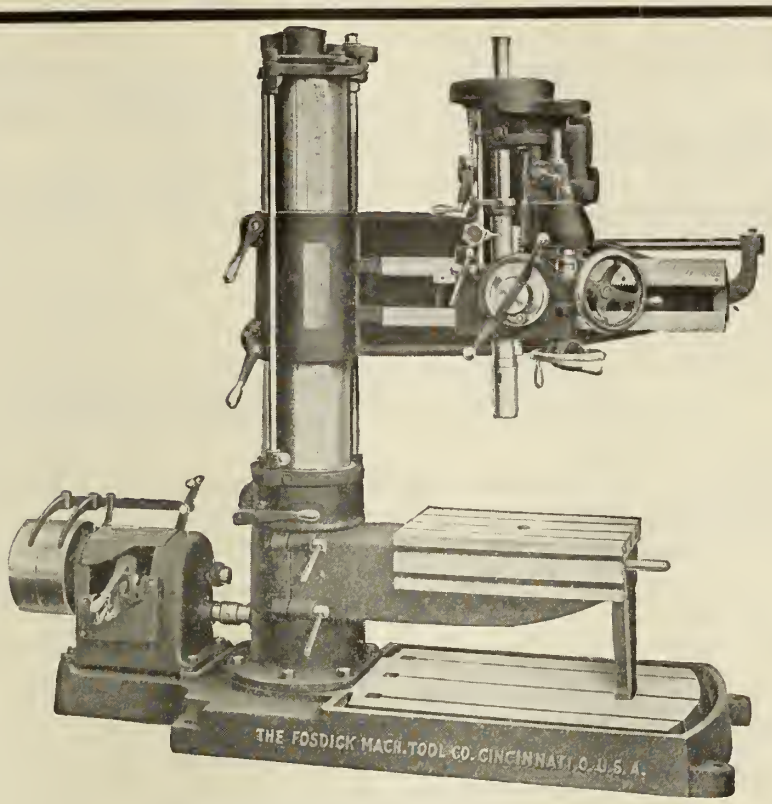
Longueuil, Que.—The council have decided to raise $90,000 to be spent on sidewalks, roads, etc. A. Ste. Marie is town engineer.

Alexandria, Ont. — A representative of the American Financial & Promoting Co., interviewed the Board of Trade recently to lay before them a number of proposals regarding the establishment of new industries here.

Berlin, Ont.—The Ontario Municipal and Railway Board have ratified a by-law to raise $67,000, recently submitted by the Berlin Light Commission. This will enable the commissioners to let the contract for the new gas-holder.

Guelph, Ont.—At the annual meeting of the Board of Trade held on April 22, the following officers were elected:—President, Alex. Simmers; vice-president, W. E. Buckingham. The secretary-treasurership was left in the hands of the new council of the board.

Berlin, Ont.—The city council on April 20, decided to purchase a 50-horse-power motor fire truck, valued at $3,400, equipped with one 40-gallon chemical tank from the Gramm Motor Co., of Walkerville. It is expected the new fire hall in the north ward will be completely equipped in six weeks.



Morris, Man. — The Acetylene Construction Co., of Brandon, have con-

Fosdick High-Duty Radials have many superior advantages.

IF IT'S MACHINERY WRITE "WILLIAMS"

The A. R. Williams Machinery Co., Ltd., 64-66 Front St. W., Toronto

cluded a deal with the Morris town council for the purchase of the town gas plant. The purchase price was $3,500, and included the town contracts for street lights for ten years. The by-law ratifying the agreement will be submitted to the ratepayers for approval by vote.

Belleville, Ont. — The officers of the Board of Trade of this city elected for the ensuing year are: President, H. F. Ketcheson; vice-presidents, F. S. Deacon, J. W. Johnson, M.P.P.; treasurer, John Elliott; secretary, Col. W. N. Ponton, K.C.; chairman of transportation, ex-Mayor H. W. Ackerman; executive council: C. M. Reid, W. C Springer, T. Blackburn, J. O. Henty, C. J. Bowell, W. B. Riggs, Col. L. W. Marsh, A. J. McLaren, O. Scott, W. B. Deacon, Mark Sprague; auditors, H. Sneyd, A. M. Chapman.

General Industrial

Brampton, Ont. — The Lindus Co., Ltd., will erect a plant to cost about $50,000.

Toronto, Ont.—The Gerhard Heintzman Piano Co., is contemplating the erection of a factory at Vancouver, B.C.

Sudbury, Ont.—The Provincial Government have made a grant of $50,000 to be expended on road improvements in this district.

St. Boniface, Man.—The town council are negotiating with a company who propose building a plant to make automobile tires.

Waterford, Ont.—The United Universal Chemical & Electrical Co., will erect a factory for the manufacture of electrical fixtures, telephones, etc.

Port Colborne, Ont. — The by-law granting a fixed assessment of $10,000 for a term of ten years to the Niagara Grain & Feed Co., was carried by a large majority.

Corunna, Ont.—The Canadian Oil Co. will start this week to put down a concrete underground tank, 60 x 60 feet, with a capacity of 10,000 barrels of crude oil.

Goderich, Ont.—The salt plant located here and owned by John Ransford, of Clinton, will have its capacity increased from an output of 120 to 800 barrels daily, at a cost of $40,000 for machinery.

Calgary, Alta.—The British Columbia Refining Co., have purchased a site here and will install four storage tanks, each having a capacity of 12,000 gallons. It is probable that a refinery will be built here if oil be found in sufficiently large quantities.

Winnipeg, Man.—The Cocoa-Cola Co. will establish a branch here. S. C. Dobbs, vice-president of the company, states that a site has been purchased and a factory will be erected at a cost of $250,000.

Peterborough, Ont.—A manufacturer of children's shoes who is now operating on a small scale in another Ontario city, will, it is understood, locate here, if he should be successful in securing sufficient stockholders' capital.

Weyburn, Sask.—The Winnipeg Oil Co., have recently made extensive additions to their oil plant at this point. Two large new steel tanks of 20,000 gallons capacity have been installed with the most modern facilities for barreling. Mr. E. N. Howard is manager.

Galt, Ont.—The Maple Leaf Bedding Co. has been organized with the following officers:—President, J. C. Dietrich, Galt; vice-president, C. C. Osborne, Toronto; treasurer and managing director, Roy Torrance; Galt; secretary, G. Gordon Plaxton, Toronto; J. W. Daw, Hamilton, director. The concern will take over the bed manufacturing business formerly conducted by the Shurly, Dietrich Co., Ltd., whose plant was re-

cently destroyed by fire. Twelve thousand is asked from the town of Galt. A by-law authorizing the loan will be submitted.

Estevan, Sask.—William Kinney, of Kenora, president of the Great West Brick and Coal Co., has made arrangements whereby the municipal power plant will supply him with the remaining available capacity of current. Development work entailing an expenditure of approximately $100,000 will be commenced in May. The plant will be the largest of its kind in Saskatchewan.

Wood Working

Welland, Ont.—The Welland Lumber Co., Ltd., will erect a sash and door factory here.

Campbellford, Ont.—The Northumberland Paper & Electric Co., will improve and enlarge its box-board mill.

Eburne, B.C.—It is reported that the Merritt Lumber Co. will erect a lumber and shingle mill at an estimated cost of $50,000.

New Westminster, B.C.—The Westminster Woodworking Co. have leased the site of the old Cliff Canning Co., and will build a factory.

Blairmore, Alta.—The McLaren Lumber Co., contemplates the erection of a sawmill, at a cost of $200,000. Machinery, boilers, etc., will be required.

New Westminster, B.C.—The British-Canadian Lumber Corporation, who were obliged to close down their plant on Lulu Island, have decided to start operations again.

New Westminster, B.C.—The Shull Co. will erect a large shingle mill here. Twenty-five machines will be installed at first; the total capacity being half a million shingles per day.

New Westminster, B.C.—It is announced that the M. B. King Lumber Co. have secured control of timber limits owned by D. K. Campbell, and that a large sawmill will be erected, with a capacity of 100,000 feet per day.

Kemptville, Ont.—The sash and door factory and planing mill formerly owned by the Palmer Lumber Co., which has been closed since last October, has started operations under R. D. McMaster.

Redcliff, Alta.—R. S. Houston and A. B. Henley have started erecting their new planing mill. The building will be 50 x 80 feet and one-storey high for the present, allowance being made for the addition of two more storeys later. The company will manufacture mouldings, sashes and doors.

Eburne, B.C.—It is announced that negotiations are proceeding between the council and three companies who are proposing to locate here. The industries comprise a lumber mill, shingle mill, and box factory respectively.

Trade Gossip

The Boving Co., of Canada, Ltd., Toronto, has been granted a license to carry on business in the Province of British Columbia.

The North Bay Steamship Co. has been organized, with headquarters at Port Hood, N.S. The steamer Kinburn has been purchased, and will be refitted.

A. Belanger, Ltd., Montmagny, Que., have taken over the foundry and stove works, formerly the property of Mr. A. Belanger, who has been appointed to the office of honorary president.

William Hamilton Co., Ltd., Peterborough, Ont., have been awarded a contract by the town of Outremont, Que., for 125 combination lighting and trolley poles and for 375 ornamental lighting standards.

Masson, Ltd., Quebec, have taken over the structural steel and foundry business formerly carried on by A. D. Masson. The directors are Messrs. D. Masson, A. D. Masson, J. Masson and E. D. Kellog, M.E.

The Burrard Engineering Co., which was awarded the contract for the laying of the riveted pipe for the flow line from Humpback reservoir to the city. A capital of one hundred thousand dollars is authorized and the company is empowered to carry on general business as engineers, contractors, builders, pipemakers, etc.

Nova Scotia Pig Iron. — Rogers, Brown & Co. are continuing to import high-phosphorus Nova Scotia pig iron. The first cargo was shipped from Sydney, N.S., by the Dominion Iron & Steel Co. the first week in April, and discharged at Philadelphia. Two more steamers carrying cargoes of pig iron sailed from Sydney last week—one for Bridgeport, Conn., and one for Philadelphia—and this iron will be imported by the firm in large quantities hereafter.

The Eastern Steel Co., Ltd., Halifax, N.S., has been incorporated by James A. Stairs, Halifax, and others, with a capital stock of $1,000,000. It has purchased the plants and good will of the Brown Machine Co., and the Bailey-Underwood Co., both of Trenton, N.S., and will continue the manufacture of coal-handling machinery, agricultural implements and kindred lines made by these companies. It is stated that plans are in progress for additions to the plants and equipment.

German Business Men Coming.—Hon. Geo. E. Foster, Minister of Trade and Commerce, has received communications from Leipzig informing him that it is proposed to organize a German business men's trip to Canada in the year 1915, spending some five or six weeks in seeing different parts of Canada. The Minister is informed that great interest is being taken by men prominent in financial and social circles in the intended visit. There seems little doubt at present that it will be a very representative and important party of exploration.

Wage Reductions.—One who has been spending some time in a number of industrial centres of the United States says that it would not be surprising if wage reductions become general there before long. In iron and steel circles there is a belief that the independent steel companies will reduce wages, and it is thought that this tendency will shortly spread to the building and other trades, inasmuch as there is not sufficient work in sight to give employment to all. He offers the view that a similar development is likely to take place in Canada.

The Poulsen System of Wireless will probably be in operation early next month between Great Britain and Canada. Two stations, one at Ballybunion, County Kerry, Ireland, and the other at Newcastle, N.B., are now being fitted with powerful apparatus. The new company proposes to give the public a service at eight cents a word, and the press at four cents. The company under contract with the Canadian Government is the Universal Radio Syndicate and under this arrangement the all-British Empire telegraphic route will be complete.

Steel of Canada Annual.—The annual meeting of the shareholders of the Steel Company of Canada was held in Hamilton on April 27, when the following officers were re-elected:—C. S. Wilcox, president; C. A. Birge, vice-president; Robert Hobson, vice-president and general manager; directors, Charles Alexander, Providence, R.I.; W. D. Mathews, Toronto; John Milne, William Southam, Hamilton; Sir Edmund Osler, Toronto; F. H. Whitton, Hon. William Gibson and Lloyd Harris, Brantford; S. H. Champ, secretary-treasurer. The directors' report, which stated that last year was the best in the history of the company, was adopted. It was stated that the plant was just now running irregularly, but

DIVIDENDS INCREASED

by the use of

Asbestos Lubricants That Kill Heat and Friction.

ASBESTOLENE

A lubricant that is manufactured specially to meet the growing demand for a high-grade friction-eliminating substance, one that prevents heat due to friction, and reduces that friction itself to the minimum.

SPEDOLENE

Designed especially for use in connection with Transmissions, Differentials, Universal Joints, Bearings, and all worn gears in Motor Cars or Trucks. Where rapidly-moving parts are to be satisfactorily lubricated, this cannot be equalled.

AXOLENE

Is the most economical grease. Where there is a demand for a heavier-bodied lubricant, this meets the requirements perfectly. It does not become hardened with age, it is not affected by atmospheric changes. It meets with general favor as a lubricant where slower speeds are to be encountered.

ASBESTOS LUBRICATION IS THE COMING ELIMINATOR OF BEARING TROUBLES

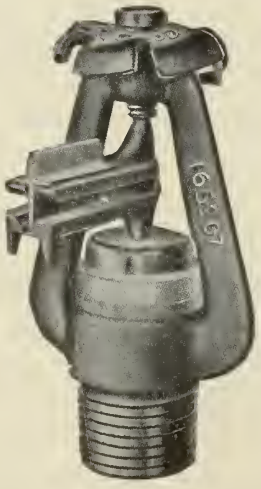
Send for complete information, and how to add to YOUR profits.

THE RAILWAY ASBESTOS PACKING CO., LIMITED

Home Office and Factory: SHERBROOKE, P.Q.

Montreal Office: 30 St. Francois Xavier St.

Having your plant fully covered by insurance is not protecting you against



—Inability to fill prevailing orders.

—Unemployment and the consequent disintegration of a valuable working force.

—Inability to go after new orders because you cannot fill them on time.

Manufacturers' Automatic Sprinklers

put out the fires before they get any headway

The Insurance Companies recognize their efficiency and reliability by reducing insurance rates about 80%.

The saving these sprinklers effect in insurance rates alone will pay their cost in five years—**you eventually get fire protection for nothing.**

They can be easily installed in your old or new plant.

Write for full details and estimates.

The General Fire Equipment Company, Limited

72 Queen St. East, Toronto, Canada

the opinion was expressed that the change in the tariff would benefit the company.

Algoma Steel Corporation.—New high records in the production of pig iron rails and coke were made by the Algoma Steel Corporation during March. The production of pig iron was 30,420 tons, as compared with the previous record of 29,800 tons in April, 1913; of rails, 29,640 tons as compared with the previous record of 29,200 tons last July, and of coke, 40,760 tons, as compared with the previous record of 37,600 tons in January, 1913. This month the corporation received an order for 10,000 tons from the Grand Trunk Railway, at 50 cents per ton over the price paid by competitors. The corporation is now the one Canadian steel plant running full at the moment, and is likely to run full for some time ahead. With orders in sight, the corporation's output bids fair to be covered until September.

Coal for Government Railways.—Following up the purchase by Mr. Gutelius of American coal for the Intercolonial Railway last autumn, Hon. Dr. Reid, Acting Minister of Railways, announced in Parliament on April 27, in response to an inquiry by Mr. E. M. Macdonald, of Pictou, that Mr. Gutelius had asked the following firms in the United States to submit offers for the supply of coal for the Intercolonial and Prince Edward Island Railways for the coming year, 1914-15:—J. Bert Russ, Buffalo; American Steel Co., Pittsburgh; Moreland Coke Co., Pittsburgh; Ernest Law & Co., Philadelphia; Keystone Coal & Coke Co., Philadelphia; Walkins Coal Co., Philadelphia; Pennsylvania Coal & Coke Co., New York; George Hall Coal Co., Ogdensburg; J. W. Weaver & Co., Philadelphia; Whitney & Kemmerer, Philadelphia; the Grain Coal Mining Co., Buffalo, and H. W. Somers, Albany.

Welland Machine & Foundries, Ltd.—The annual meeting of the Welland Machine & Foundries, Ltd., was held at the company's office on Friday, April 10. The business transacted in the past year was quite large, and a very satisfactory report was presented to the shareholders. The directorate was authorized by the shareholders to proceed with the erection of the new foundry building, which is now necessary owing to the increased business. The new structure will be directly north of the present plant, and the Grand Trunk Railway are altering the sidings to suit the new conditions. Plans are already drawn, the contract will be let immediately, and construction will proceed rapidly. Following are the officers and directors for the ensuing year:—President, David Ross; vice-president and general manager, Wm. Edestrand; secretary-treasurer, B. J. McCormick; directors, D. Ross, Gordon Ross, Wm. Edestrand, B. J. McCormick and Edward Hooker.

Tenders

Tottenham, Ont.—Tenders are being called, until May 8, for cast iron pipe, valves, water tank, engines and pumps. Plans and specifications may be obtained from the office of the engineers, James, Loudon, Hertzberg, Toronto.

Toronto, Ont.—Tenders will be received, addressed to the chairman of the Board of Control, City Hall, up to June 2nd, 1914, as follows: For the complete construction of a reinforced concrete bridge on Crawford street, over Bellwoods Park. Specification and tender form may be obtained upon application at the office of the Railway and Bridge Section, Department of Works, City Hall.

Toronto, Ont. — Sealed tenders, addressed to the secretary-treasurer of the Board of Education, will be received until May 12th, 1914, for wood working tools and equipment for Riverdale Collegiate manual training department; supplying science apparatus and chemicals for collegiate institutes; supplying machinery and other equipment, science apparatus, chemicals, etc., for Technical School; supplying science apparatus and chemicals for High School of Commerce. Specifications may be seen and all informations obtained at the office of the Clerk of Supplies, City Hall. W. C. Wilkinson, secretary-treasurer.

Kamsack, Sask.—Tenders will be received by the sec.-treasurer until Wednesday, May 13th, for the following works: — (A) — Labor, laying water mains and sewers; (B) — Power house and filter house; (C)—Furnishing materials for, and erecting water tower; (D)—Furnishing cast iron water pipes; (E)—Furnishing fire hydrants and valves; (F)—Furnishing and installing pressure filters; (G)—Furnishing and installing pumping machinery; (H) — Furnishing and erecting boilers; (J)—Furnishing and erecting steam engine; (K)—Furnishing and erecting generator; (R)—Labor and material for construction of concrete reservoir; (S)—Furnishing sewer pipe; (T)—Construction of concrete walk; (X)—Labor and material for construction of sewage disposal works. Alternative bids will be received for gas producers and engines in place of boilers and steam engine, and of same capacity. Plans and specifications may be seen at the office of Chipman & Power, engineers, Toronto and Winnipeg, and at the Town Hall, Kamsack. A. A. Crawford, sec.-treas.

Building Notes

Camrose, Alta.—R. A. Lister & Co., of Dursley, England, and Toronto, Ont., have built a warehouse for gasoline engines and "Melotte" cream separators.

Toronto, Ont.—A building permit has been issued to Dennison & Stephens, architects, for a five-storey brick warehouse to cost $82,000.

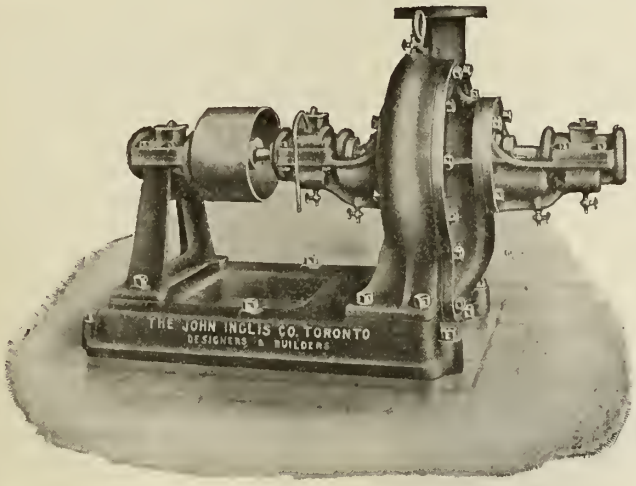
Toronto, Ont.—A large seven-storey factory and warehouse, to cost about $100,000, is to be erected at the southwest corner of Portland and Adelaide streets.

Toronto, Ont.—The United Drug Co., secured on April 22, a permit to erect a five-storey manufacturing building on Broadview avenue south of Queen street, to cost $125,000.

London, Ont.—The Ford Motor Co., have practically decided to purchase a site 102 x 330 feet, on which they will erect a four-storey building at a cost of $100,000. The building will be used as a warehouse and service station.

Toronto, Ont.—A twelve-storey office building is to be erected at the southwest corner of Toronto and Adelaide streets to cost at least half a million dollars, for the Excelsior Life Insurance Co. Tenders will be invited in a few weeks' time.

Toronto, Ont.—The Andrew Wilson Wholesale Tobacco Co., have asked tenders for the erection of an addition to the old Minerva Building at 10 Front street west. The addition to be built will be a steel fireproof structure and will cost between $75,000 and $10,000.



Toronto, Ont. — The Canadian J. H. Parker Co., of this city, has secured the contract of building the new Connaught Hotel, which will be erected on the Waldorf Hotel site. The contract calls for a $600,000 building, with a frontage of 102 feet. It will have eleven stories, and will be of brick, steel, and fireproof construction.

New Incorporations

The Favary Tire Co., Ltd., has been incorporated at Toronto, with a capital of $5,000, to manufacture various kinds of tires, etc., at Toronto. Incorporators—F. Kitching, F. V. Clisdell and A. W. Briggs, all of Toronto.

The Canadian Expansion Bolt Co., Ltd., has been incorporated at Toronto, with a capital of &40,000, to manufacture expansion bolts and appliances at Toronto. Incorporators—J. A. Kent, J. H. McDonald and E. W. Wright, all of Toronto.

ASSOCIATION AND PERSONAL

A Weekly Record of Current Association News and of Individuals
Who Have Been More or Less Prominent in Machinery Circles

Trade Gossip

The Hawley Down Draft Furnace Co., of Easton, Penn., manufacturers of the "Hawley-Schwartz" metal melting furnaces, report an increased demand for their product, as adapted for the melting of aluminum.

Keiths, Ltd., Toronto, have given up their brass manufacturing business and are disposing of the machinery. They are now occupying a new building at 297 Campbell ave., and will specialize in automatic sprinkling systems, refrigerating plants, plumbing and heating, etc.

The Jones Underfeed Stoker Co., Toronto, have sold eighteen stokers to the St. Lawrence Pulp & Paper Corporation at Chandler, Que. A battery of six 500 h.p. boilers will be installed and equipped with "Dutch oven" furnaces for burning paper mill refuse in addition to coal.

The Steam Lightship Halifax 19, built by Bow, McLachlan & Co., Paisley, Scotland, for the Canadian Government, has completed her trials and will sail for Halifax in a few days. The trials, which were of a varied and exacting character, were successfully carried through.

The Canadian Steam Boiler & Equipment Co., Toronto, makers of the "Cyclone" grate bar, are building a new factory which will include a machine shop, assembling room, castings storage and office. Provision is being made for a foundry which will be erected in the near future.

Marshall Sons & Co., of Canada, Ltd., the Canadian branch of one of the largest engineering firms in England, have opened an agency in Regina with Ross & Haynes, who have taken over the old Leader building on Hamilton street. The Marshall Company have already done an extensive business in tractors and rollers throughout Canada, through the agency of the Sawyer-Massey has been incorporated at Victoria, B.C. Company.

National Association of Manufacturers.—The National Association of Manufacturers will hold its next annual meeting at the Waldorf-Astoria Hotel, New York City, Tuesday and Wednesday, May 19 and 20. The secretary's office for registration will open in the west foyer of the hotel at 10 a.m., May 18. The usual banquet will be held in the grand ballroom of the hotel on the evening of May 20. Tickets for the banquet will be $10 for each person.

Schuchardt & Schutte are removing their Canadian headquarters on May 1 from the Coristine Bldg., Montreal, to 42 Adelaide St., W., Toronto, where they have arranged for a commodious show room and office, which will give them greatly increased facilities for handling their business.

WHO'S WHO.

C. E. ALLISON,
Vice-President and Manager, the Canadian Ice Machine Co., Toronto.

Personal

J. H. A. Acer, of the Laurentide Co., has returned from New York to Montreal.

Sir Thomas Shaughnessy, president of the C.P.R., has returned to Montreal from Winnipeg.

H. Biermans, managing director of the Belgo-Canadian Pulp & Paper Co., has returned from abroad.

Clarence F. Smith, general manager of Ames Holden Co., has returned to Montreal from New York.

Capt. McDonald, formerly captain of the steamer City of Sydney, has been appointed captain of the steamer Heathcote.

H. S. Holt, president of the Royal Bank of Canada, who has been in Europe for some time, sailed for Canada, on April 29th, by the White Star liner Olympic.

George H. Waring, of St. John, N.B., died on April 20, aged 65. Mr. Waring was president and manager of the Union Foundry and Machine Works at Carleton, N.B.

Norman Hicks, who acted as resident engineer of the town of Weston, Ont., while the sewage system was being installed, has been permanently engaged in this capacity at a salary of $100 per month.

Frederick W. Cowie, chief engineer of the Montreal Harbor Board, has been awarded the Telford gold medal for his paper on "Transportation Problems in Canada and the Montreal Harbor," by the council of the Institute of Civil Engineers, London, Eng.

Commander D. H. Dawson, R.N.R., F. R.G.S., formerly captain of the S.S. Dominion of the Black Diamond Line, died at Southport, England on April 2. The funeral was held at Anfield cemetery, Liverpool, on April 4th. The late Commander Dawson was well known in Sydney, C.B., and universally admired and liked by a large circle of friends.

T. H. Welsford, of Liverpool, Eng., prominent in shipping circles in the old country, and president of the Union Steamship Co., of Vancouver, B.C., was in Winnipeg recently on his way to the coast. Mr. Welsford is making his annual trip of inspection of the company's equipment there. Discussing business in a general way, Mr. Welsford declared that trade was slack, but he anticipated a revival soon in the coast-wise shipping business.

"Safety First." — The Canadian Safety Engineering Bureau, with Mr. Riley Schenck as manager, have opened an office at 109 Mail Bldg., Toronto. The gentlemen connected with the Bureau have, we understand, had a number of years' experience in safety engineering in addition to being qualified in other branches of mechanical work. They propose specializing in all branches of accident prevention, in so far as same can be brought about by the adoption of the most approved modern methods and appliances.

Contracts Awarded

Humboldt, Sask. — The largest contract for the water works and sewerage, that of laying the water mains, sewers and the force main from the lake to Humboldt, has been secured by Flanagan & Murphy, of Fort William. The contract will amount to over $100,000.

St. Catharines, Ont. — The contract for section No. 4A of the Welland Ship Canal has been awarded to Maguire & Cameron, for a sum slightly under $84,000. The contract is not in the original layout of the canal proper, but is being made to form a connecting link between the old canal and the channel now being excavated.

Ottawa, Ont. — The Government has awarded to the Pacific Dredging Co., a contract for a jetty wall 22,300 feet long and for a channel 300 feet wide and 10 feet deep at low water at the mouth of the Fraser River, between the north arm of the river and the west end of McMillan Island. The work will cost $755,993.

Railways—Bridges

Toronto, Ont.—The work of enlarging the Canadian Pacific Railway bridge over the Humber river at Lambton Mills will be commenced shortly.

Calgary, Alta.—By-laws will be voted on by the ratepayers on May 14, to authorize, by means of a loan the raising of $513,000 for the purpose of constructting one steel and two reinforced concrete bridges over the Bow River.

Cornwall, Ont.—Work will be commenced on the construction of the Glengarry and Stormont Railway as soon as weather conditions permit. The promoters have let the contracts for several sections ofthe road, which is to connect Cornwall with the C.P.R. at St. Polycarpe, Que., through country which has never been served by a railroad. It is expected that the rails will be laid the entire length of the road by November 1, and that trains will be running a month later.

Winnipeg, Man.—In the course of an interview, J. D. McArthur, the well-known railway contractor, stated that steel had been laid from Edmonton to Lesser Slave Lake, a distance of 170 miles, and that the valley of the Peace River country would be reached this summer. Mr. McArthur also announced that work would commence this spring on the Great Waterways Railway to Fort McMurray, north-east of Edmonton, a distance of 350 miles. This line to Dunvegan and British Columbia will extend 400 miles into the very heart of the Peace River district.

Neglect blew up the Boiler

Refrigeration

Quebec, Que.—It is reported that the Harris Abattoir Co. will erect a large cold storage plant here.

Windsor, Ont.—The Central Ice Co. propose to purchase a piece of land adjoining the site of their new plant, on which to erect a public abattoir. It is estimated that the building will cost $15,000. A by-law will probably be voted on, to grant exemptions.

London, Ont.—Silverwood's, Ltd., will build a cold-storage plant in the near future. The plant is to be operated by 500-volt, three-phase motors. The De la Vergne Machine Co., New York, has been awarded the contract for the refrigerating machinery and creamery equipment. Watt & Blackwell, architects.

Saskatoon, Sask. — The Early Fruit Co. has had plans prepared for a cold storage warehouse to be erected on Ontario street at a cost of $90,000. The intention of the company is to construct two storeys this year and leave provision for the addition of two more storeys as soon as business warrants. The building will be complete and modern in every detail.

The York Mfg. Co., York, Pa., have recently made the following installations in Canada: Arnold Bros., Toronto, Ont., one 6-ton vertical single-acting belt driven enclosed type refrigerating machine and high pressure side complete; G. S. McConkey, Toronto, Ont., one 4-ton vertical single-acting belt driven enclosed type refrigerating machine and high pressure side complete; McDonalds Consolidated, Winnipeg, Man., one 12-ton vertical single acting belt driven enclosed type refrigerating machine and high pressure side complete; City Creamery Co., Ltd., Winnipeg, Man., one 8-ton vertical single-acting belt driven enclosed type refrigerating machine and high pressure side complete.

HAWKINS *LIBRARY OF* ELECTRICITY
In 6 Leather Pocket Books
Price per $1 Volume

Here is a set of books that no man in the ELECTRICAL FIELD should do without. This is the ELECTRICAL AGE in which we live; ELECTRICITY now controls more trades, directs more men, offers more opportunities than any other power that man has yet discovered. Do you wish to know the underlying principles of MODERN ELECTRICAL PRACTICE?

If so, **HAWKINS ELECTRICAL GUIDES** will give you the information. In reality they are a school within themselves, containing a complete study course with QUESTIONS, ANSWERS AND ILLUSTRATIONS, written in plain everyday language so that a practical man can understand the "HOW, WHEN AND WHY" OF ELECTRICITY.

"THAT'S JUST WHAT I NEED"

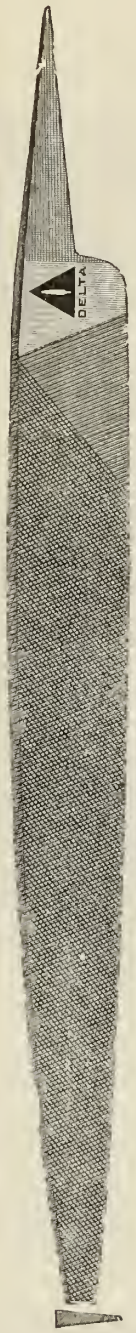
Read over the titles shown on the back of each volume, and note the scope of each book. They are handsomely bound in flexible black leather with gold edges and will readily go in the pocket. THEY ARE NOT ONLY THE BEST, BUT THE CHEAPEST WORKS PUBLISHED ON ELECTRICITY.

Each book is complete in itself and will be supplied $1.00 per copy, but we believe that the complete set is the best bargain.

The books can speak for themselves and a careful examination, page by page, and illustration by illustration, will convince you of their big value.

If you will fill out the following coupon giving all the information requested, WE WILL SUBMIT THE SIX VOLUMES FOR EXAMINATION ON CONDITIONS NAMED.

FREE EXAMINATION OFFER
THEO. AUDEL & CO., 72 5th Ave., NEW YORK



Please submit me for examination HAWKINS ELECTRICAL GUIDES (Price $1 each.)

Ship at once, prepaid the 6 numbers; if satisfactory I agree to send you $1 within seven days and to further mail you $1 each month until paid.

Defend yourself

FILES OF QUALITY

If your files soon get dull you soon put a lot of energy to naught, you turn out "roughly-finished" work—all this goes to hinder a raise in wages, because the blame is invariably laid on the user—not on the files.

Insist that your stock-keeper supply you with

Delta Files

They are the only line from 3 to 24 inches that is made absolutely of crucible steel. **They cut fast and clean,** and on account of their exceptional fine temper they **retain their sharpness longer.**

The "Delta Service" means reduced file cost as well as increased efficiency of workman and larger output.

In the meantime, ask your hardware dealer for one. If after putting it to a rigid test you find it lacking anything that we claim for it, you will get your money back.

TRADE MARK

DELTA

Look for this trade-mark on every tang. It's our guarantee of satisfaction.

Catalogues

Pumps.—The Gray Mfg. & Machine Co., Toronto, Ont., have sent us a copy of a new bulletin No. 12, which describes the steam and power pumps which they make. A full line is dealt with, each type being illustrated together with a brief but comprehensive description. Tables are included giving the principal dimensions and capacity of each size.

"Grundy" Coupling made by the Canadian Bond Hanger & Coupling Co., Alexandria, Ont., is the subject of leaflet "D," being distributed by the above company. A complete description, with illustrations, is given of the coupling which is of the flexible insulated type for motor drives of all kinds. A table is included giving the prinicipal dimensions of each size and there is also included a useful telegraph code for use when ordering couplings. Copies may be obtained from the Toronto office, 82 Adelaide street, east.

Metal Sawing Machines, made by Charles Wicksteed & Co., Kettering, England. Catalogue "C" describes and illustrates the "Aeme" metal saw built in various types and sizes, principally for heavy work. Among the lines dealt with are multiple saws and machines for special work. A complete description covering the general design is given together with a full specification for each type. The catalogue also contains a table giving the average cutting speeds for various sizes of material for each saw. Copies of this catalogue may be obtained from the Canadian agents, the Dominion Machinery Co., Toronto, Ont.

Book Reviews

We have received for review a copy of the "**Foerdertechnik,**" a monthly publication issued at Wittenberg, Germany, and dealing with the construction and operation of hoisting apparatus and transport plants, pumps and blowers. To those possessing a knowledge of the German language, the various articles appearing therein will appeal in an interesting manner and will be of considerable practical value. Among articles which the management inform us will appear in the near future are: Types of cranes built in foreign countries, pneumatic coal conveying plants, conveyor plants, development of floating cranes, wire ropes, mine railways, centrifugal pumps, centrifugal condensers, compressed air, etc.

The Express Service and Rates, by W. H. Chandler, published by the La Salle Extension University, Chicago, Ill. The author of this book is assistant manager of the traffic bureau, of the Merchants' Association of New York, and is therefore well qualified to write about a subject of this nature. The book contains 340 pages of matter dealing with the express service in all its phases, including the development, organization, classification, contracts, rates, tariffs, financial department, parcel post, etc. The method of fixing rates is explained in detail as are all the tariffs used by the express companies. The tariffs have been reproduced as it is recognized that the reader, may, in some cases, have trouble in obtaining them from the express companies. Further, the inclusion of the tariffs will assist the reader in understanding the text, for without them he could not obtain a sufficiently comprehensive idea of their structure. This will be an exceedingly useful book for those employed by express companies as it deals with a complex subject in a clear and readable manner.

"Conservation of Coal in Canada" is the title of a report published by the Commission of Conservation appointed by the Dominion Government, and compiled by W. J. Dick, mining engineer of the commission. One striking feature indicated by the report is the dependence of Canada upon the United States for its supply of anthracite coal. This is clearly indicated by means of a map, various sections being colored, to show the origin of coal used in the different areas. It is within the range of possibility that the United States may in the near future prohibit the export of anthracite. Such a situation makes it clear that Canada should husband her coal resources and prevent waste as far as possible. With this in view the report suggests changes in coal mine leases. In addition, it is urged that the government should carry out investigation as to the suitability of low grade coals for use in gas producers and in the manufacture of briquettes for domestic use. Several pages are devoted to descriptions of briquette plants and coke ovens. The greater part of the report, some 163 pages, contains a description of the various mines in the provinces where coal is found, covering such matters as quality, method of mining, equipment, ventilation, etc. The report contains several excellent photographs, tables giving thicknesses of coal seams, diagrams of mine interiors and two folding maps.

THE CAMEL HAIR BELTING

As a Power Transmitter is Cheapest—Why?

BECAUSE! It lasts longer than any other belt on the market.
BECAUSE! It slips just one-half that of any other belting.
BECAUSE! It will run equally well in damp, wet or a dry atmosphere.
BECAUSE! It is less affected by acid fumes and high temperatures than any other Belting.
BECAUSE! It is uniform in thickness and runs true.
BECAUSE! Of its great strength—almost twice that of best oak-tanned double leather.
BECAUSE! It requires much less attention than other styles of belting.
BECAUSE! The stretch comes out quickly and after taking up once or twice (according to load and nature of run) requires little or no more attention.
BECAUSE! It transmits more power than any other belting.

Spot and Butt Welding MACHINES

Do the Work Rapidly and Economically

We are the pioneer builders of Electric Welders in Canada. If you do any quantity of welding or riveting you should investigate, at once, the merit of AGNEW Electric Welders. Let us study your welding problems and advance our ideas regarding your particular work.

Our machines are of the highest electrical efficiency, and we find by actual meter tests that they will in all cases do a given amount of work with less consumption of current than any other machine on the market.

We have good facilities for demonstrating these claims and the intending purchaser of electric-welding apparatus who expects to use a considerable amount of electric current should investigate this feature.

No. 21-D Spot Welder

will spot-weld from No. 30 to No. 10 sheet metal.
Depth of throat, 14 inches.
Adjustment of lower horn, 7 inches.
Water-cooled reversible points.
Height of dies from floor, 40 inches.
Floor space, 18 x 32 inches.
Transformer capacity, 15 K.W.
Operated either by foot-lever or belt power, leaving operator free to use both hands.
Speed 100 to 160 welds per minute.

No. 10-C Butt Welder

Capacity ⅛ in. to ⅝ in. round, ⅛ x 2 inches flat, stroke of movable carriage, 3 inches.
Adjustment of clamps, 1¼ inches.
Vertical adjustment of fixed carriage, ¾ inch above and below movable carriage.
Tilting adjustment of 10 degrees.
Transformer capacity, 10 K.W.
Height, floor to dies, 32 inches.
Will weld any length Butt or Tee.

Ask for catalogue. We are in position to build machines for any special work.

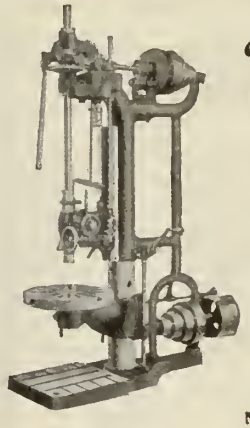
THIS is our 20-ton jack mounted on 15 in. Steel Base, is 22 in. high, rise 11 in., can be detached from base and used in the ordinary way.



Loads of half the rated capacity of the jack can be raised on the foot from within 3 in. of the ground.

For raising or moving buildings, heavy machinery, loaded cars, or anything in the tons to handle, this jack will be found ready, reliable, convenient and quick in operation. Working parts protected, and can be practically run in oil while the outside is always neat and clean.

Manufactured by

Canadian Brakeshoe Co. Ltd., Sherbrooke, Que.

Successors to The Canada Lifting Jack Co.

Let This

"Mechanic's Drill"

solve your drilling problems for you.

It has gone into the plants of many of our customers and done their drill press work so efficiently that at the first opportunity they've ordered more.

The "Mechanic's" is a straight forward drill press with lots of power to drive high speed drills up to the limit of their endurance. It may be had either with or without Tapping Attachment, and is made in a variety of sizes, both single and multiple spindle.

MANUFACTURED BY
DIAMOND SAW & STAMPING WORKS
BUFFALO, N.Y., U.S.A.

The construction of
"Erie" Steam Drop Hammers
is different.

That difference, coupled with sound engineering ability and the very best of materials, has made for "ERIE" HAMMERS an enviable reputation.
The Guides are designed so that they have a solid backing in the Frames the full length. Breakage is positively eliminated. The Cylinder and Frames are securely held in place by a steel tie plate, making the entire upper works as a unit, thus assuring accurate forgings.
Would you like to know other strong points of the "ERIE" construction? Send for catalogs.

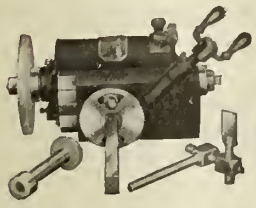
"Cincinnati" Electrics

Are Sent on Trial



Return if not Satisfactory

Hand or Breast Drill

Made in 12 sizes, ¼ to 2½" capacity. Weight from 7 pounds up. Ball and Thrust Bearings throughout. All gears and working parts hardened.

SCREW FEED DRILLS
SCOTCH RADIAL DRILLS.

Tool Post Grinder

All sizes and types. ¼ to 3 H. P. Weights from 16 pounds up. For grinding centers, dies, rolls, internal or surface grinding of all kinds. Motor fully enclosed. Dust and dirt proof. Bronze bearings adjustable to wear.

BENCH AND FLOOR GRINDERS.

HAND AND AERIAL GRINDERS.

New Catalog No. 6 ?

For Sale by Mussens Limited, Montreal and Branches.
H. W. Petrie, Limited, Toronto.

Cincinnati Electrical Tool Co.

Cincinnati, Ohio

Let the "Brazo-Hardening" Process Save Half Your Reamer Costs

The benefit accrues to you in this way. Our

"PEERLESS" HIGH-SPEED REAMER

has blades of the finest quality, selected high speed steel, solidly joined by our patented "Brazo-hardening" process to a one piece soft steel body. We can thus provide durable cutting edges and a soft, tough supporting body at about half the cost of other high speed reamers.

"Peerless" Blades *never come loose* — a new reamer if they show evidence of such a defect. That's a liberal enough guarantee to make you interested in full details.

Ask for Catalog No. 36-C.

The CLEVELAND Twist Drill Co.

New York CLEVELAND, OHIO Chicago

The Grip Tightens as the cutting strain increases—which is one reason why the L. G. Die always leaves a clean thread.

This Picture

is the envy of Tap and Die Makers the World Over

The Little Giant Die

is the only adjustable screw-cutting die on the market providing

Perpetual Compensation for Wear

Little Giant

screw-cutting die-collets last forever. The cutting surfaces last until literally ground away and are then renewable at nominal cost.

Try them.

Made in **Galt** Ontario

Rivett Bench Lathes

No. 5 Lathe with No. 5 Tool Post

Specifications:—Bed .....38″
Swing ..... 8″
Chuck Capacity .....⅞″

A heavy, rigid machine suitable for large work requiring accuracy.

The large Spindle Capacity is supported by more solid construction throughout.

This Lathe is especially appreciated by Manufacturers. It may be fitted up for Threading, Grinding, Milling and also as a very strong, handy and economical Screw Machine.

Write us about your requirements.

IF A BETTER TAP IS EVER MADE **W. & R.** WILL MAKE IT.

The Idea

of a tap having a relief on every tooth, similar to the relief on other metal-cutting tools — drills, milling cutters, reamers, etc.—was first put into practical operation in Greenfield, Mass., 35 *years ago.*

To-day, the *LIGHTNING Machine Relieved Tap* is used all over the civilized world, even to *Cape Town,* which is about as far from Greenfield as one can get and stay on old Mother Earth.

Exclusively

used by many prominent railway systems, automobile plants, bolt and nut works and machine shops of the world, because it is built upon sound mechanical principles, is distinctive, and

Economical

One-third the width of each land is concentric—the remaining two-thirds being eccentric—thus abolishing $\frac{2}{3}$ the friction surface of ordinary taps.

Made only by the Pioneers.

Nova Scotia Steel and Coal Company, Ltd.

BEG TO ANNOUNCE

That their new Steam-hydraulic Forge Shop is now in operation, as also is their recently installed "Harmet" Fluid Compression Plant.

These improvements bring "Scotia's" Equipment abreast of the best foreign forges.

They are accordingly open to supply forgings of all shapes and sizes, made of Best Ordinary or Fluid Compressed Open-hearth Steel, and satisfying the most severe specifications.

For prices and particulars apply to

Western Sales Office, Room 14, Windsor Hotel, Montreal, Que., or Head Office, New Glasgow, Nova Scotia

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

CASTINGS

ALL CASTINGS GUARANTEED TO YOUR APPROVAL

Why We make Arctic Metal

Because the consumers are looking for a babbitt that is always uniform; that will stand up under Heavy Pressure; that will keep cool under High Speed. The consumers have found these conditions in

Arctic Metal

Manufactured by

Tallman Brass & Metal Co.
HAMILTON, ONT.

The advertiser would like to know where you saw his advertisement—tell him.

No, Stevens' Stopper won't stop a train, but it will stop the blow hole in a defective casting so that you cannot find it.

In this way, it helps your bank account. The casting that otherwise would have to go to the scrap heap can be converted into good coin of the realm.
Same color as the rest of the casting. Doesn't look like a blue patch on Casey's faded overalls.
How to use Stevens' Stopper, or Circle Cement:
Stevens' Stopper is a fine powder, used with a little water and made into a paste—the hole is easily filled with a putty knife or trowel. It takes anywhere from two to twenty-four hours, depending upon the size of the patch, for the filler to become as hard as the casting itself. When rubbed with a file it shows the color of the casting, hence it is the best filler and the one thing that saves your castings, and that means the saving of your dollars.
Another thing—I do not ask a fancy price for it.
A pound will save many dollars' worth of castings. Put up in 5-lb., 10-lb., and 25-lb. cans.

FREDERIC B. STEVENS

Manufacturer of
Foundry Facings and Supplies, Buffing Compositions and Platers' Supplies

Corner Larned and Third Sts. DETROIT, MICH.

BRANCHES

Windsor, Ont., 20 Pitt St.

A sign of good profits

FOR YOU--FOR EVERY FOUNDRYMAN

Shelton Metallic Filler

is a guarantee for *bigger results* in any foundry ---it eliminates *make-overs.*

Make-overs are the profit consumers of the foundry. They are a form of waste that is absolutely useless, and should not be permitted in any up-to-date shop.

Here is a chance to stop your losses. Shelton Metallic Filler is guaranteed to fill in and completely obliterate blow holes, sand holes, etc. It becomes part of the casting itself, is durable and can never be detected. It has been used with great success for many years.
Better write to us at once.

Every casting means a profit if you are a user of SHELTON METALLIC FILLER
At a slight cost the "bum" casting can be made as good as the *best---don't throw it on the scrap heap.*

SHELTON METALLIC FILLER CO.
DERBY, CONN.

The advertiser would like to know where you saw his advertisement—tell him.

PERFORATED METALS

Write to us regarding your Tool Room partition problems. We can save you space and light.

We make any size perforation in any kind of metal required.

Canada Wire & Iron Goods Co., Hamilton

We also manufacture

Wire Cloth for all purposes
Concrete Reinforcement
Molders' Riddles and Bellows
Metal Clothes Lockers
Steel Factory Stools
Window Guards
Ornamental Wire and Iron Work

FOR YOUR SHOP

Our steel shelving occupies 30% less space than wood. It's easily erected and can readily be changed to bins and back again to shelving. Built on the unit system, more sections can be added any time. It's fire-proof, sanitary and vermin-proof. If you move you can take it down without breakage, and it costs no more, generally less, than wood. It's interesting. We will gladly tell you more about it.

The Lathe of Maximum Production

WE have put into this new Gap Lathe every feature that makes for economical production — speed in changing, accuracy of cut, quality of cut, and solidity of bed.

All parts taking strain are of ample excess size, and all bearings are large. The gap is solidly supported, and is of extra width and depth.

Correspond with us for full particulars. You can instal one or a battery of these machines in any size of gap within wide limits, and in any length of bed. Write us.

Six Busy Vertical Shapers

Large manufacturing concern proves wide usefulness of these distinctive tools. Highly efficient on die work as well as all regular slotter and horizontal shaper jobs.

Why There Should Be Some Busy Ones in Your Shop

Great Range. In the first place, the Vertical Shaper is a machine of great range and you should never have any difficulty keeping it busy. More adaptable and accurate than horizontal shaper or ordinary slotter.

Angular Adjustment of Ram is a new feature, advantageous on a large variety of work, especially in the working out of die clearances.

Convex, Concave or Irregular Surfaces are handled with greatest ease.

Swiveling Ram Head enables tool to be set in most advantageous position. Also all sides of work can be finished at one setting.

When Working to Line, tool enters work where line is scratched, and line can be accurately followed.

Most Conveniently Operated. The controlling mechanism is constructed and located with view to affording greatest possible convenience in operating the machine. Ram may be started or stopped independent of driving motor or belt by means of clutch.

Stability and Accuracy. While the stability and power of the machine are such as to withstand the severest manufacturing service, the Vertical Shaper is a precision tool in every particular.

Two Sizes—With 6½" and 10½" maximum stroke of ram.

Write for new 12-page circular "Vertical Shapers" fully describing and illustrating both sizes.

Pratt & Whitney Co. Hartford, Conn., U.S.A.

The advertiser would like to know where you saw his advertisement—tell him.

Table removed from table arm, showing the large flat hearing on which the table arm rests.

Head of our drill on which is mounted the gear feed.

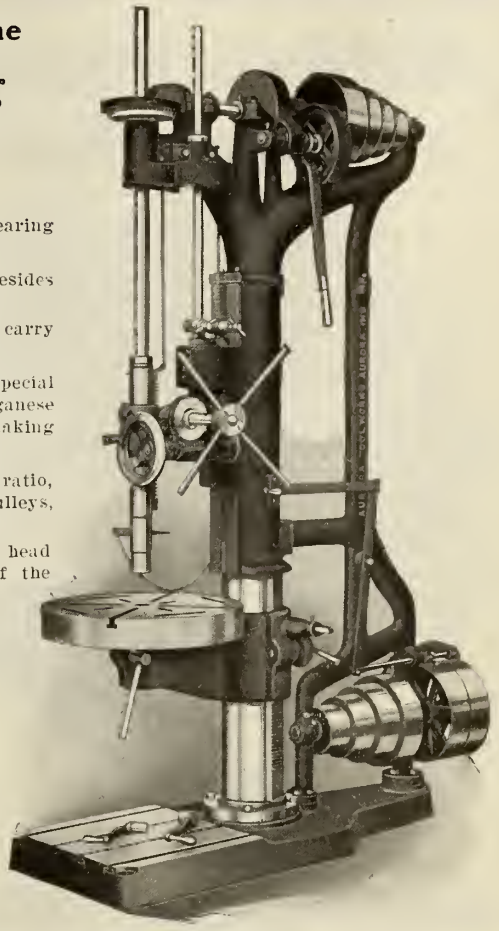
All these gears are fully enclosed and run in oil.

Important Features in the Aurora Drilling Machine

COLUMN is heavy and well ribbed.

HEAD AND TABLE ARM has long bearing on columu.

TABLE rests on a large flat bearing besides the usual pivot hearing.



PULLEYS are large in diameter aud carry a wide belt.

ALL LARGE GEARS are made of special semi-steel with high perceutage of manganese and carhon, and pinions are of steel, making an excellent wearing combination.

SPINDLE BEVEL GEARS are of 3 to 1 ratio, which means a high speed for driviug pulleys, giving pleuty of power.

THE ALL-GEARED FEED is on the head and controlled directly at the hauds of the operator. Each feed is indicated and can be chauged while machine is runuing. Feed gears are of hardened steel and run in oil in a fully enclosed case.

AURORA DRILLS are built iu 20", 21" and 25" Stationary Head type; and 22", 24", 26", 28", 32", 36", 40" and 44" Sliding Head type.

Wilt Twist Drills Start Into the World in Perfect Physical Condition

They are perfectly designed and in perfect balance. They are machined to a marvelous degree of accuracy. They are hardened with scientific exactness.

No wonder they drill more holes of a given size per minute per dollar of cost. **Wilt Twist Drills** come honestly by their sturdy constitution. They inherit it.

The stock they come from is the finest—most carefully selected, most accurately tested steel that can be bought.

It is steel with a pedigree, if you please—steel that has a long record of worthy performances back of it.

No wonder **Wilt Twist Drills** stand up better, last longer, and almost never break down under strain.

But the most essential difference in **Wilt Twist Drills** is found in the process by which they are made.

Instead of six or seven machining processes which have been necessary heretofore in the making of a drill, Wilt Drills are machined complete at a single chucking.

The rough stock goes into the automatic machine and comes out a perfectly cut Drill.

You can readily understand what that means in accuracy and uniformity.

Add to this exactness in machining the perfectly regulated hardening of the electric furnace, and you get some conception of **Wilt Twist Drill** quality.

The Wilt Twist Drill Company of Canada, Limited

WALKERVILLE **ONTARIO**

You Can Keep Down The Cost

by watching the little points. If you spend too much for fuel in your baking, bluing, enameling, japanning or drying department—if your goods are in the oven longer than necessary—your cost is too high. Fuel economy and rapid treatment are combined in the highest degree in the

Crawford Sectional Oven

The positive forced circulation from the blower through the **ENCLOSED FLAME GAS BURNER** drives off moisture and fumes so rapidly that in many cases the time of treatment in the oven has been cut down more than half, and with a decided reduction in fuel costs.

If you are having any trouble with your oven equipment, let us confer with you.

Crawford Sectional Oven, designed to do high heat-baking lacquer on brass goods, also for baking coils and armatures. A truck is used, either platform or frame.

Our folders on "Correct Core and Mold Drying" and "Drying Out Armature Coils" on request. Send to-day!

"A Press with a Reputation of Lasting Service, Quality, Accuracy and Efficiency"

On account of the particular design of our Straight Side Power Presses, they are preferred by many manufacturers for heavy cutting, forming, stamping and embossing. They are specially adapted for cutting and forming hardware, sewing machine and typewriter parts, and work of this character, as the straight side frame is heavy and compact, avoiding all possibility of any uneven spring. We can furnish special feeds to suit different requirements.

A "BB" Press installation means PERFECT SATISFACTION.

Milwaukee Millers

The Choice of the Piece-Worker

Give an experienced piece-worker a job requiring milling. If he has his choice of several makes of milling machines, he will choose a Milwaukee.

Why?

Because he knows that with it he can turn out the greatest possible number of pieces per day. The reasons for this are many and important to every milling machine user.

Milwaukee Millers are extremely simple of operation. The number of operating handles has been reduced to a minimum. The levers are in positions where they can be easily handled, particularly those that require frequent manipulation. Moreover, all mechanism controlled by the levers is so constructed that it will withstand hard usage and be easily operated under auy conditious whatsoever.

Milwaukee Millers are built for heavy duty. They can take fast, heavy cuts without undue vibratiou. The column is a semi-steel casting, deep box section in shape, and strongly ribbed. The knee is also a semi-steel casting, box section in shape, and with solid top. The table is of semi-steel, amply proportioned and finished on both sides.

Milwaukee Millers have also, in the Double Over-Arm, a patented feature of the greatest importance. The capacity of a double over-arm Milwaukee Miller is limited only by the ability of the cutter to take the cut. The cutter, not the machine, is the limiting factor in figuring how fast or deep a cut may be taken.

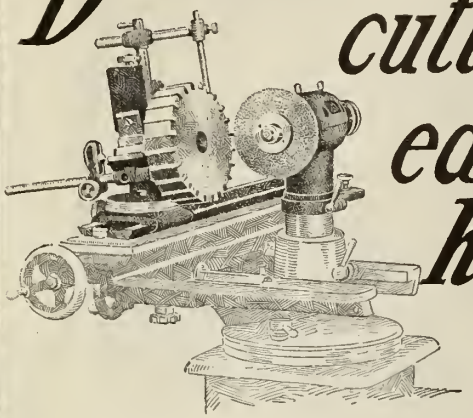
Milwaukee Millers are all of the constant speed type. This means that the same power is delivered to the cutter, whether it be a large cutter runniug at low speed or a small cutter running at high speed. Maximum efficiency is obtained in either case.

Milwaukee Millers are all furnished equipped with an effective system of cutter lubrication. This is as essential when working in steel. It adds fully 40% to the productivity of the cutters, prolongs their term of usefulness, and lengtheus the intervals between sharpenings.

Milwaukee Millers are provided with 18 speed changes in geometrical progression with a ratio of approximately 1.25 to 1. This permits a very wide range of speed changes to be secured easily on a percentage basis. The 18 changes are obtained with only 10 gears. The feed mechanism is arranged to provide 12 changes. These are in geometrical progressiou, starting with a minimum of ½" per minute and advancing in fixed geometrical ratio to 16" per minute. No two feeds can be accidentally placed in operation at once.

These are the main features making for convenience of operating, ability to take fast and heavy cuts, etc. They explain why piece-workers choose Milwaukee Millers.

The complete facts about these machines are very interesting and important to milling machine users. They are given in our Bulletins. Write for your copies of these Bulletius and we will also put your name on the list for a copy of the Kearney & Trecker Catalog No. 19, which will be off the press early in June.



We are pleased to have you consult us on any milling problem.

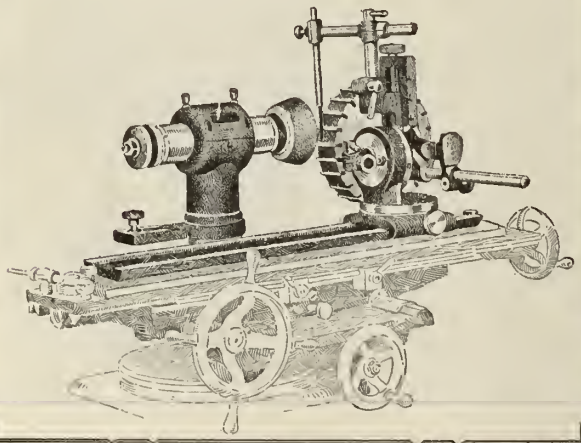
KEARNEY & TRECKER COMPANY, MILWAUKEE, WIS.

Canadian Agents: Williams & Wilson, Ltd., Montreal; Rudel-Belnap Machinery Co., Ltd., Toronto; A. R. Williams Machinery Co., Ltd., Winnipeg.

Do your cutter edges hold up

The problem of grinding cutters, so that the edges "hold up" and show greater production before they have to be re-ground, has been solved by

NORTON ALUNDUM GRINDING WHEELS



By reason of our ability to produce special tempers of Alundum for grinding alloy and high-carbon steels, we are enabled to offer grinding wheels that will neither burn, check nor "skin soften" the hardest milling cutters.

437

The advertiser would like to know where you saw his advertisement—tell him.

This is our New Improved Wet Tool Grinder—an ideal machine for your grinding needs. It is of extra heavy construction throughout, and all bearings are of large proportion and self-oiling.

The packingless vertical centrifugal pump furnishes a liberal though easily regulated supply of water to the face of the wheel; the large water-pan prevents water splashing on the floor.

This is one of the best wet-grinders made. Built in 14 20 and 30-inch size. **Get our catalog, which describes it in detail.**

J. G. Blount Company

EVERETT, MASS., U.S.A.

Your brake drum will never slip if it is lined with J-M NON-BURN BRAKE LINING

This lining takes a "bulldog" grip on the brake drum the instant you apply full pressure to the brake. And it never loosens for a second until you release the pressure.

Its wonderful gripping power is not affected by water, oil, grit, frictional heat or anything else.

J-M Non-Burn never chars, burns nor disintegrates in any way. Just wears down slowly and evenly until the last fibre is gone.

By actual test J-M Non-Burn Lining outwears 12 ordinary linings. This is because it is **mineral through and through**—made of asbestos fibre reinforced with brass wire. Not a particle of perishable material in it.

You can save time, money, and labor, and prevent possibility of accident, by lining your brake drums with J-M "Non-Burn."

The YOST

Solid Jaw and Swivel Bottom Machinist's Vise

MADE IN CANADA.

A vise with a grip like grim death; a durability that defies time and the hardest usage.

A vise that will give you a lifetime of perfect service and satis.action. The metal in a Yost Vise is of faultless quality, perfectly distributed and the workmanship is

Incomparably Good

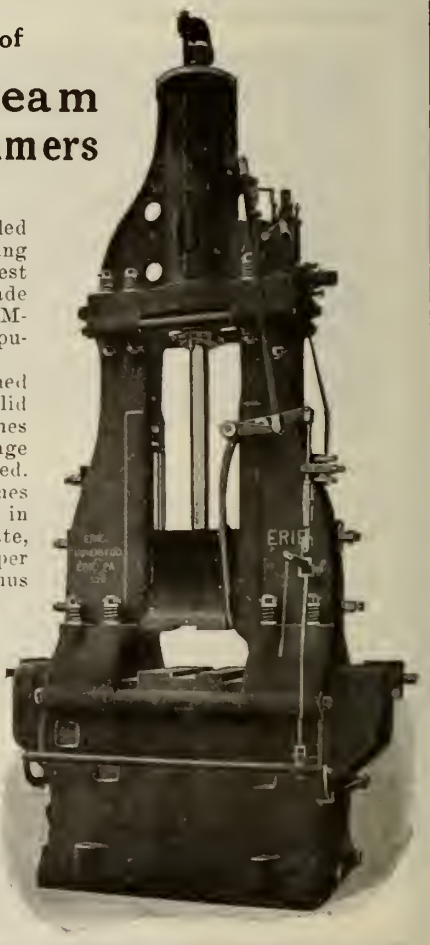
The National catalog would certainly interest you. Write us, asking for a copy.

National Machinery & Supply Co., Ltd.
HAMILTON - - ONTARIO

This Guarantee Goes With Every Vise: We fully guarantee all of our Vises to be satisfactory in every particular and will promptly replace, without cost, any parts broken or badly worn when such failures are due to faulty material or construction.

The construction of

"Erie" Steam Drop Hammers



is different.

That difference, coupled with sound engineering ability and the very best of materials, has made for "ERIE" HAMMERS an enviable reputation.

The Guides are designed so that they have a solid backing in the Frames the full length. Breakage is positively eliminated.

The Cylinder and Frames are securely held in place by a steel tie plate, making the entire upper works as a unit, thus assuring accurate forgings.

Would you like to know other strong points of the "ERIE" construction? Send for catalogs.

Erie Foundry Company
Erie, Pennsylvania

Have You a Buyer's Power ?

¶ Whether you are a Purchasing Agent or a Purchasing Proprietor a heavy load of double responsibilty is yours every time you make a decision and sign an order.

¶ Can you discharge that responsibility with a brain charged with instantly available information?

¶ We can furnish an indexed brain to any buyer of machinery. We have been doing it for several years to some of the keenest and highest paid Purchasing Agents in Canada. This is how we do it:

¶ Half a dozen pages from the back of "Canadian Machinery" you will find a Buyers' Directory. This is arranged alphabetically according to the name of the machine. Below each item is given a list of the most reliable makers.

¶ If you want a Drill or a Lathe, a Milling Machine or a Motor, a Reamer or a Riveter, a Planer or a Punch, or any kind of machine or piece of equipment, all you have to do to bring the best makers to your desk is to consult the Buyers' Directory in "Canadian Machinery."

¶ Here is to be found a list of the most dependable manufacturers. It is a universal catalog of all your needs and a ready reference guide to good buying. It is an Honor Roll of Progressive Machinery Makers. It is a brain saver and a reputation builder for purchasing agents—a time saver and a money maker for men who do their own buying.

¶ Take a careful inventory of your present and possible requirements. Note what machines or supplies you will have to purchase in the near future. Consult Machinery's Buyers' Directory and write for the catalogs and the literature of the firms, who are in a position to supply you. Get loaded for emergencies. Fill up on information. Decide before you have to who can best meet your requirements.

¶ Perhaps the very machine or machines you will need are illustrated and described in this number of Machinery. Look up the Buyers' Directory and then the Advertisers' Index (just inside the back cover.) Better still, take a look through all the advertising pages and read as you run. It won't take you long and it will do you a whole lot of good.

¶ Let "Canadian Machinery" help you in your buying, and tell where you obtained the information

YALE

Triplex Block

"From Hook to Hook a Line of Steel"

When you buy a Yale Triplex Block, you are getting nearly double the value for the same money.

The Yale Triplex Block is rated on the basis of the long ton, 2,240 lbs. to the ton. Each rated ton is tested with a 50 per cent. overload, or 3,360 lbs. This rating gives you excess capacity in every Yale Triplex Block you buy. It is much stronger than any other Block made.

The buying of a hoist is important. The user cannot afford to make a mistake. The preservation of life and property depends upon it. The careless man buys first. The careful man gets his facts, then buys on his judgment. He does not rely on another man's judgment. The man who buys haphazard, or only on price, is more apt to be wrong than right. It is costly experience to be wrong in buying a Hoist.

The Yale Triplex Block stands ready to prove its safety, economy, and easy-lifting qualities in any kind of hoisting.

When you buy a Yale Triplex Block, a duplicate part can be secured in a hurry from the larger cities in all parts of the world. You do not have to wait for the factory.

This Block is good enough to bear the name Yale, known throughout the world for over half a century as indicating the best in locks and hardware. This name is on every important part. Look for the name YALE on your Block and the parts which you order for it.

Concerning the Practical Metallurgy of Tool Steel

By J. Pedie Sanderson, B.A.Sc.

The metallurgy of iron and steel and particularly tool steel is usually couched in language that the man who must devote himself to its working and using cannot readily understand. It is the purpose of this article to give scientific reasons for the behavior of tool steel under the conditions met with by the toolsmith in as simple words as possible.

IN 1740, Huntsman introduced his method of melting blister steel in crucibles and gave engineers cast steel, a good uniform metal with which to form their turning tools. When suitably treated, it was very satisfactory from the standpoint of hardness but had little stability and gave out if its working temperature rose above a certain point. This, of course, strictly limited its cutting efficiency, yet for 130 years it was the only tool steel available. In 1870, Mushet made his renowned discovery that, by the addition of tungsten to Huntsman's steel its ability to stand high cutting temperatures was enormously increased. Since then, chromium, vanadium, molybdenum, cobalt, nickel and other elements have been added separately or in combination, with the result that we now have our modern high-speed steels.

The words iron and steel refer to compounds of iron with some other substances. On account of the fact that iron is never found in its pure state, it has been necessary to give to absolutely pure iron another name, hence it is called ferrite. The chief substances which naturally associate themselves with iron are carbon, silicon, manganese and sulphur. The carbon is by far the most important and, in considering the hardening of steel we shall discuss its effects alone. The nature of the compound is governed independently and completely by two things, viz:—The amount and condition of the carbon content and temperature.

Carbon.

Irons containing a very low percentage of carbon are classed among the mild steels. As the percentage is increased the steel becomes less and less workable and is more and more easily hardened until this quality reaches its maximum at .9 per cent. of carbon. If the carbon be still increased, the hardening becomes again more difficult and the nature of the metal more granular and brittle until with about 2 per cent. of carbon, the cast irons begin, and may continue until a carbon content as high as 6 per cent. is reached.

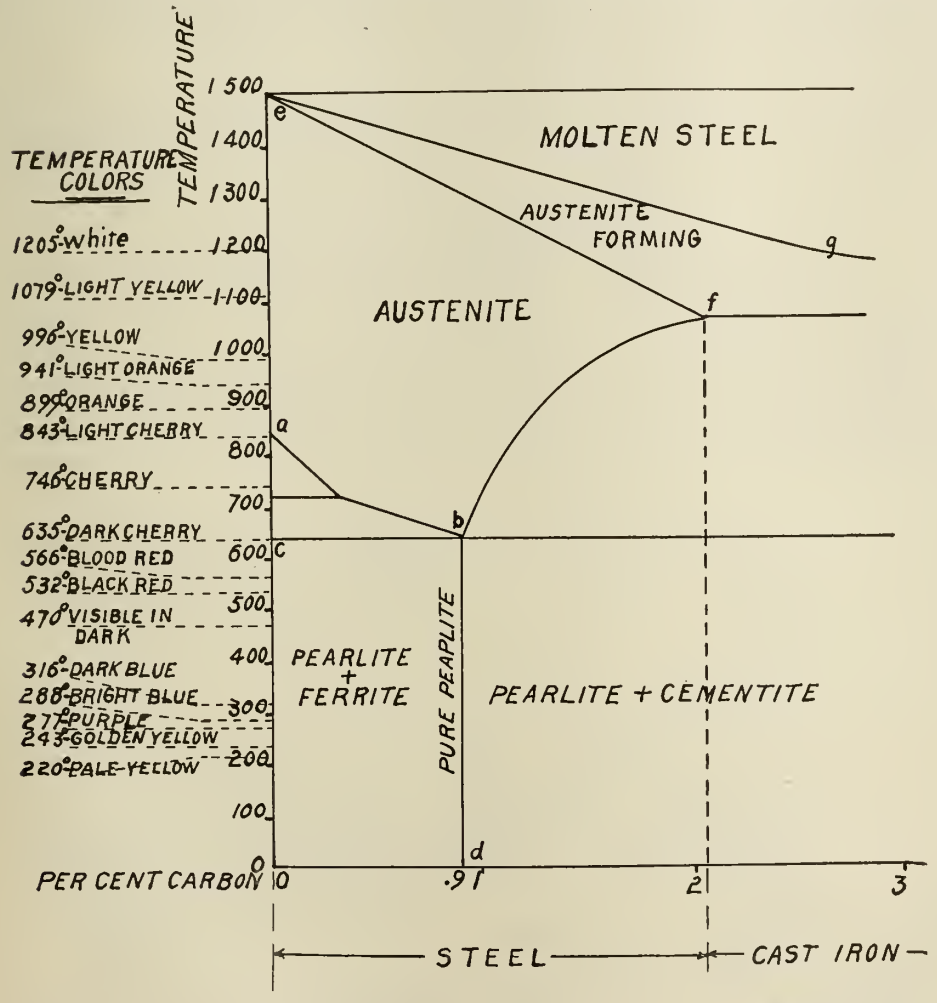

DIAGRAM SHOWING EFFECT OF CARBON PERCENTAGE UPON TEMPERATURES AT WHICH DIFFERENT CHANGES TAKE PLACE.

Temperature.

To study the changes in consistency due to temperature we begin with molten steel, which is simply cast iron from which most of the carbon and other impurities have been burned out or removed in some other way. It first solidifies, but the carbon remains dissolved in it. Its color is white and it is known as Austenite. At a temperature of between 900 and 700 degrees centigrade, the different constituents separate out; it ceases to be a solution, and under the microscope it has a mottled appearance very much like concrete. If cooled slowly, this process is complete at 700 degrees C.

Chemical Compounds.

In steel, the carbon is either in solution, or is in the form of a chemical compound, while cast iron may contain some in the form of free carbon or graphite. The chemical combination of iron or rather ferrite with carbon is called cementite. The combination of ferrite and carbon in steel which contains .9 per cent. of carbon and which hardens at the lowest temperature is called pearlite. If the steel contain less than this amount of carbon it consists of a mixture of ferrite and pearlite; if it contain more, the carbon constituent is in excess, hence it consists of a mixture of pearlite and cementite. Another name for steel in the pure pearlitic condition is hardenite, which name is, of course, due to its peculiar quality. As the proportion of carbon is still further increased, the metal loses its steel characteristics and becomes a mixture of cementite and graphite commonly known as cast iron.

It must be remembered that any chemical changes brought about by heat require more or less time; thus, it takes some time to change ice to water. The temperature of the water can be quickly raised to the boiling point, but again a sensible amount of time is required to change the water to steam. The same is true of steel. In order that chemical and structural changes due to tempera-

ture may work themselves out fully, the metal must be heated or cooled very slowly.

Consider a quantity of steel being thus cooled from the molten state. It first solidifies but does not change in any other way. This so-called solid solution is known as austenite and is hard and granular. As the steel is cooled down further it becomes soft and tough in texture and when cold is called annealed steel. This change begins at about 900 degrees C, and is completed at 690 degrees C, and this is known as the "recoalescence" period.

The Roberts Austin's Diagram.

Upon the diagram, the temperatures at which the above take place are represented by the lines (ab) and (bf) for the upper limits and (cb) as the lower limit or completion of the process. It will be noticed that the recalescence temperature is lowest at (b) or when the carbon content is .9 per cent., and rises rapidly with a steel of either less or greater carbon percentage.

The process of solidifying begins at temperatures represented by the line (eg) and is completed at those represented by the line (ef).

Hardening of Steel.

As already stated, these changes consist of the separating out of the pearlite, cementite (iron carbide) and ferrite, constituents of the steel, and this requires time. If a piece of steel containing say .6 per cent. of carbon be heated above its recalescence temperature, that is, until it is in the austenite condition, which, from the diagram is 740 degrees C., and is suddenly cooled in water, there is not time for the annealing process and the steel retains the characteristics of the austenite which is a hard and flinty solution.

At the recalescence temperature also, the size of the grain begins to increase. The higher the temperature above the critical point at which the steel is quenched, the coarser the grain will be. to refine the grain, heat carefully up to the critical point and no higher, and allow to cool or quench as desired.

Sir Frederick Abel and other experimenters in 1885 discovered the definite existence of iron carbide Fe_3C as a chemical compound, and showed that the hardness produced by tempering was directly related to the percentage of the total carbon present in this form. When tempered to a straw color, about 35 per cent. of the carbon would be present in the form of the carbide; when tempered to a blue color, it would contain 42 per cent. and when in the hardened untempered condition, it would contain about 96 per cent. of the carbon as carbide of iron. Here, then, was the secret of tempering, namely, the reduction of the iron carbide of pearlite to the proper percentage by reheating. When steel tools were overworked, they become heated; the carbide of iron was formed freely, the tools became soft and the edges broke down.

Effect of Tungsten, Chromium, etc.

The addition of tungsten, chromium, etc., to carbon steel produces the self-hardening and high-speed steels. The practised toolsmith knows that, by merely allowing these steels to cool gradually in dry air from different heats ranging from a cherry red to a reddish-white, all tempers may readily be obtained. The explanation of the effects of tungsten has been very recently investigated by Professors Arnold and Reid, who have found that, as the percentage of tungsten was increased, the possible formation of iron carbide became less and less, and a combination of carbon and tungsten or tungsten carbide was formed instead. With about 11.5 per cent. of tungsten, the iron carbide disappeared entirely and thus this amount of tungsten forms the lower limit of this metal in modern high-speed steels. High-speed steel then, is one in which there can be no formation of iron carbide, and thus there will be no tempering effect until the formation of tungsten carbide which takes place at a much higher temperature and which in self-hardening steels produces no softening at all.

High-Speed Steel.

The superiority of high-speed steel is therefore not due to a greater degree of hardness, but rather to a greater thermal stability; that is, it will stand up and work at much higher temperatures. With a tool of Huntsman's steel, Prof. Arnold found that 16 cubic inches of steel could be removed before the material of the tool gave way. Under exactly similar conditions, he found that 900 cubic inches of the same material could be removed by a modern high-speed steel tool.

The knowledge of the chemical reactions of the different combinations of tool steel may seem unimportant to most engineers and tool makers, but the fact remains that all great advances in its quality have been preceded or accompanied by discoveries in the metallurgical field. At any rate, now that the why and the wherefore of steel up to the present time have been found out, it is in order for some new discoveries to be made.

The Rope Drive as a Power Transmission Medium

By E. H. Ahara, Mishawaka, Ind.

Being an abstract from a paper read before the American Society of Mechanical Engineers, covering a series of tests on the transmission of power by rope-drive under various conditions.

CONCLUSIONS deducible from the data obtained seem to show that the efficiency in rope driving is considerably greater at the lower speeds than at the higher ones, the dropping off being especially noticeable above 4,500 ft. per min. of rope speed. They also show that the efficiency of a rope drive is not materially affected by distances between centres up to 150 ft., that the drop of

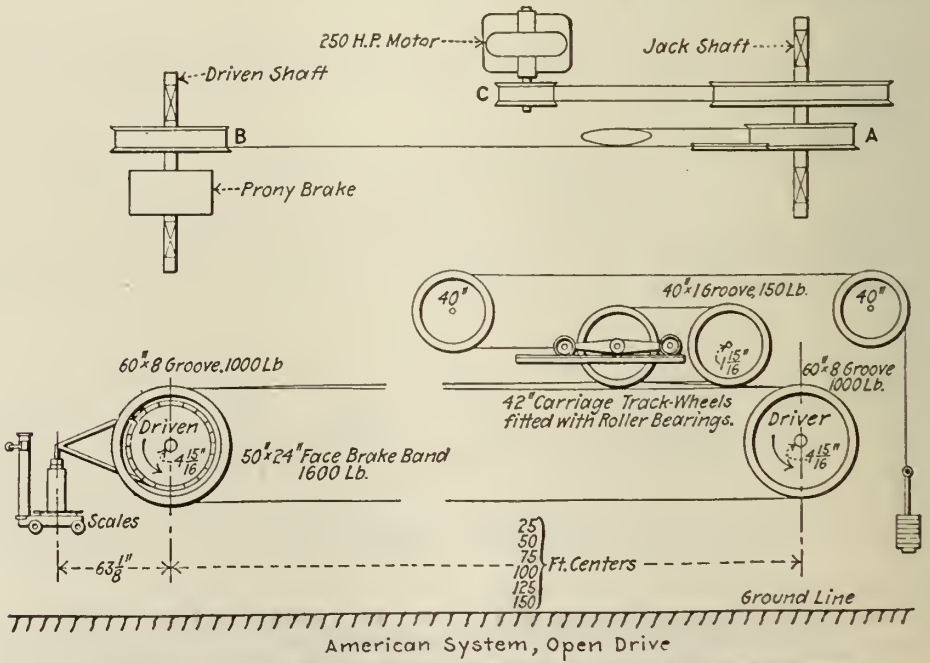

FIG. 1. GENERAL PLAN OF AMERICAN OPEN OR STRAIGHT DRIVE SYSTEM.

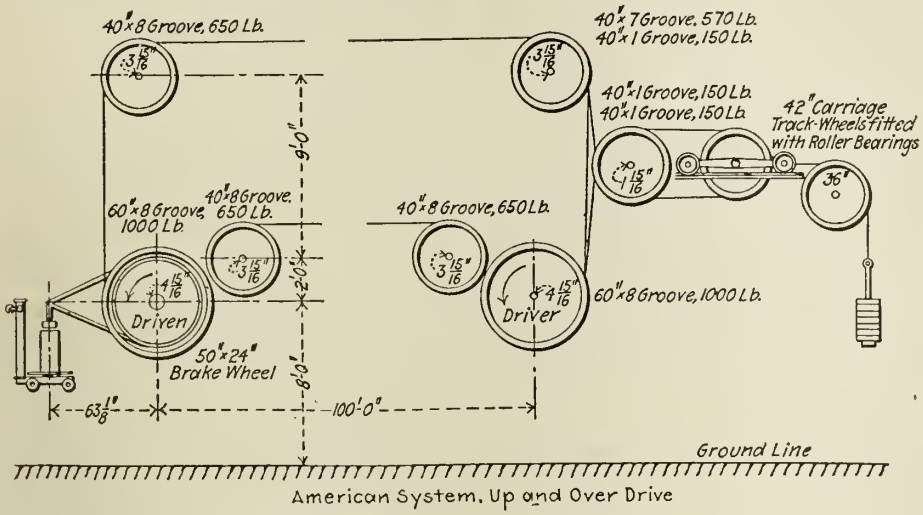
efficiency at 50 per cent. load is comparatively small over that of full load, and that if proper care be exercised to have all grooves perfect in pitch diameter, many as well as few ropes can be run on a drive with good efficiency. With the American system, increasing the slack rope tension up to 360 lb. in a 1-in. rope does not appear to decrease its efficiency, but rather to increase it, if power be used in conformity with this tension; but only such tension should be used as is necessary to drive the load needed.



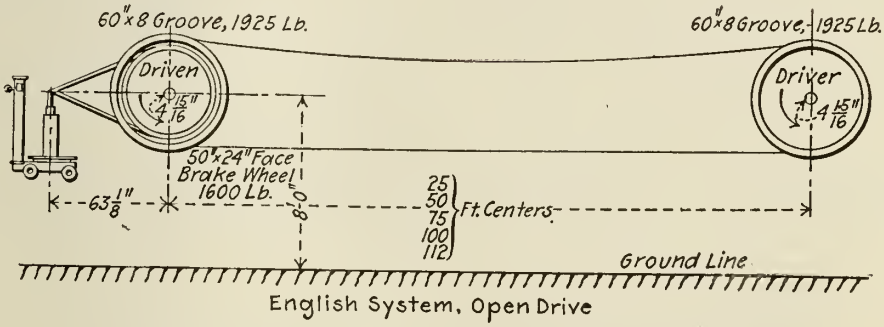


FIG. 2. GENERAL PLAN OF AMERICAN UP AND OVER, OR INDIRECT DRIVE SYSTEM.

The efficiency was measured under full, three-quarters, one-half and one-quarter loads, while one-inch best Manila rope was used. The tests cover drives of from one to eight ropes, with centres from 25 to 150 ft., on both American and English systems; also open or straight drives, as well as indirect, or up and over drives. For the rope tested the American system has very much more capacity than the English system, and has also a higher percentage of efficiency. In general it would appear that, where there is a considerable power to be transmitted, the properly worked out rope drive gives a most efficient and economical method, and where conditions are favorable to its installation no other known method of transmission will so well conserve power losses.

The efficiency as determined includes the losses in the rope itself, the friction in the bearings on the driven shaft, and the losses due to the inertia of the driven wheel and the prony-brake wheel, and, also, in the American system, the friction of the tension equipment. All tests were made to include the friction of the receiving shaft and bearings as it was thought this would more nearly approximate working conditions and make the data obtained of more general application in ordinary comparisons. All bearings used were of the ring oiling babbitted type, and the ropes were all 1-in. Manila rope of best quality, carefully treated with a rope dressing to prevent the entrance of moisture and to keep the surface in as nearly uniform condition as possible. It was found during the test that this was of great importance as very slight changes in the rope surface immediately affected its capacity and efficiency.

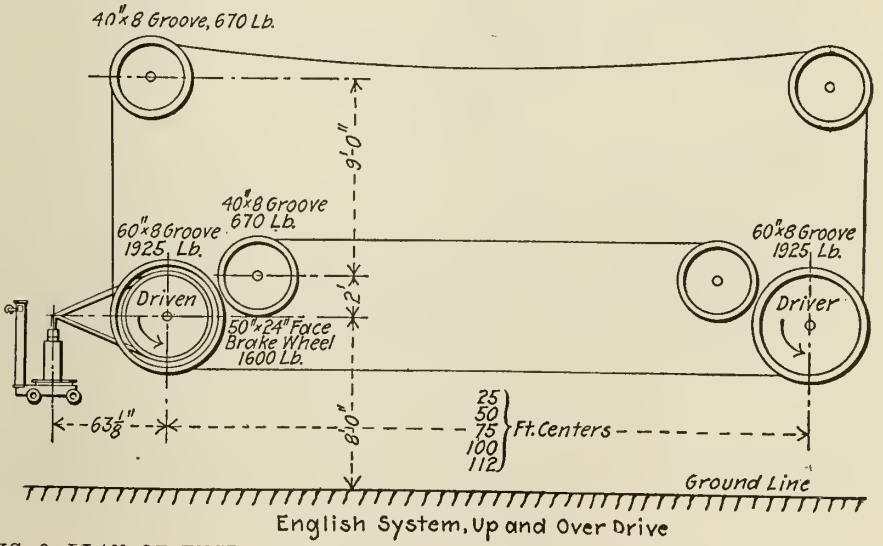

FIG. 3. PLAN OF ENGLISH OPEN DRIVE AND "UP AND OVER" DRIVE SYSTEMS.

With the American system, a lower efficiency is shown on the lower number of ropes. This is undoubtedly caused by the fact that the eight-grooved wheel made for testing eight ropes was used for all the lesser number of ropes to avoid the expense of making additional wheels with a suitable number of grooves for each drive. This together with the weight of the prony brake increased the proportional friction on the smaller loads, and is, therefore, a larger percentage of the total load in the drive of few ropes. With the friction of driven shaft eliminated, limiting the losses to those in the rope alone, it is believed the efficiency in a single rope would be as great, if not greater, than any multiple thereof.

In all of the above tests the tension of the slack side of the rope was kept as uniform as possible at 180 lb. by means of weighing the tension carriage properly. In order to ascertain what tension would give the greatest degree of efficiency, irrespective of life of rope or wearing qualities, a test was made with the slack rope under varying tensions. This was determined on one rope because the capacity of the single rope was, under the heavy tension, as great as that of the motor, so no proper comparison could be obtained on more than one rope.

Groove Pitch Feature.

One of the greatest troubles in rope driving, when installed by inexperienced

engineers, has been the lack of uniformity in pitch of the grooves where many ropes were used. This differential in the grooves compels slippage of the ropes which not only causes loss of power, but also rapidly depreciates the rope, and often causes the rope to flop around badly. To test the loss of efficiency in this case, two wheels 60 in. in diameter, of eight grooves each, were made up exactly alike so far as could be, and after most careful measurements the grooves on either wheel were found not to differ more than 1/64 in. in circumference from any other on the same sheave, and a test made. The driver was then removed, and the pitch diameter of each groove made approximately 1/32 in. less than the preceding groove so the eighth groove was ¼ in. less in diameter than the first one.

Again, it was placed on the driving shaft and a duplicate set of tests made. In this test as the first groove was ¼ in larger in pitch diameter than the eighth groove, with the sheave revolving at 160 r.p.m., there would necessarily be a slippage in an inelastic band of over ten feet per minute. The photographs taken of this differential drive, show plainly the sag of the various ropes under this condition, and how, under heavy load they stretch and slip in the grooves of the sheave. The elasticity of the rope in this case undoubtedly lends itself to aid efficient operation.

Test Procedure.

The "up and over" American drive was tested because it is typical of all but direct drives, i.e., straight from driver to driven, and the difference in efficiency between this type and the open drive will serve as a basis of comparison where but two additional right-angle turns are introduced requiring four additional idlers. This test was run on approximately 100 ft. centres with a new rope, the same rope being afterwards used in the testing of the various English drives.

In testing the English drives, in order that proper comparisons be made, the ropes were all cut to the same measured length, and the splices carefully made, so that all ropes might be equally tight when applied to the sheaves. The movable tower was then carefully moved back, the rope being run slowly meanwhile until the sag in the rope was approximately the same as in the American drive of the same centre distance in which the slack rope was under a tension of 180 lb. This is undoubtedly a higher tension than is used in general practice on the English drive system with this size of rope, and the capacities and efficiencies shown are perhaps higher than are ordinarily attained in common practice. The efficiencies, when compared by speeds, of the English open drive show a marked decrease as the speed of the rope increases, falling as low as 84.5 per cent. at 5,500 ft. rope speed.

The general tendency in all tests made, both English and American, was corroborative of this tendency toward decrease in efficiency as the speed of the rope increases. There was, however, a lack of smoothness to many of the curves owing, it was thought, to variations in rope tension, and perhaps slight changes in the surface of the rope due to climatic changes. This was very much more noticeable on the English than on the American system, the irregularity of the curve on the former being affected by the fact that a greater load was sometimes attained on a certain speed than could later be reached on the next higher speed. The efficiency of the English drive, within the limit of distances tested, remains practically constant irrespective of centre distances; while with reference to number of ropes, it increases as does the American for the first few ropes, and then remains practically constant through the additional ones.

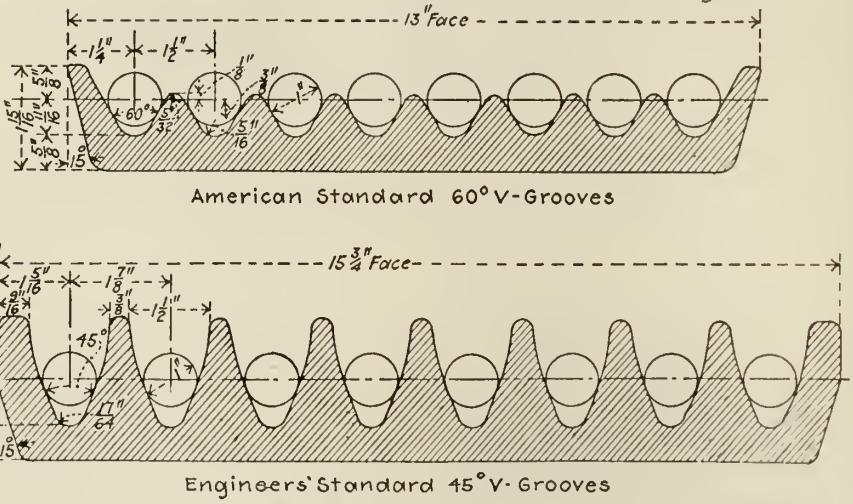

FIG. 4. DETAILS OF GROOVES USED ON DRIVER AND DRIVEN WHEELS.

In order to test the effect of tension on the English system, a comparison was made by moving the receiving tower forward 1¼ ft. after making a series of tests, and then making another corresponding series. When sheaves with proper English pinch grooves, as shown in Fig. 4, were used, there was no appreciable difference either in power transmitted or in efficiency. Greater variations than 1¼ ft. in centre distances could not be satisfactorily tried because of the slack ropes dragging on the ground.

A new rope was used on the American open drive, another new one being started with the American "up and over," which latter was also used on both the English drives. The time of introducing the new rope is mentioned because it was found that a new rope had very much less capacity, owing to its low coefficient of friction, than the same one had after it had run a short time in work, and having less capacity it would usually have less efficiency also. The stiffness of the rope when it was new also seemed to add friction to the drive owing to the bending action in passing around the sheaves, which on the test were only 60 ins. in diameter. With larger main drive wheels, where the rope is not bent to so small a radius, the efficiency would undoubtedly be slightly increased over the results here shown.

Rope Drive Capacities.

The capacities of rope drives are affected by so many variables that no particular attempt is here made to state capacity other than in general figures.

Limiting capacities obtained are in no sense to be considered as available working capacities, but merely as limits reached in driving capacities, the practical working capacity being much lower than the limits reached. It is to be regretted that the power available was not great enough to get the larger capacities, as so few points were obtainable on the American open system. Even at the low speed of 2,500 ft. four ropes could not be made to slip with the 250 h.p. available.

The irregularities of these limiting horsepower capacities are caused by many variables, some of which are weather, surface conditions of rope, condition of rope wheel grooves, etc. In connection with the groove in the wheel, it was found that if a rope began to slip in a groove and warmed it up slightly, the coefficient of friction seemed to decrease very rapidly, and if a limiting test were made under these conditions it was invariably much lower than if it were taken just before the rope started to slip. As each test had to be taken in its scheduled order, some of those dealing with limiting capacities were taken at intervals of several weeks.

As the limiting capacities of the English drive are very much lower than the American, it is thought the efficiency is likewise affected, the friction in the former case being a much larger proportion of the power delivered. Again, the English system in order to get driving power in the rope, pinches it in the narrow groove, requiring considerable force to withdraw it again. This effort being exerted continuously uses up considerable power. The American system, on the contrary, uses a 60-deg. groove, in which the rope lies freely and withdraws without effort.

DESIGN AND STRENGTH OF WORM GEARING.

By A. Best.

MUCH has been said at the meetings of our engineering societies, and much has been written in journals and text-books on the subject of gear strengths, but one may still look in vain for a simple solution to the problem of what power a given worm gear will safely transmit.

All gearing should be designed with a fair factor of safety, and in most cases now the size of the gear is more or less determined by the nature of the load: whether subject to shock or fairly steady. Another influential factor is the length of life expected from the gears. These conditions naturally cause the designer to get well beyond the point of destruction. It is found then that gears are really designed for wear, and it is, therefore, desirable to watch those points which, though they do not seriously increase the weight or cost of the gears, allow more accurate meshing. The consequences are—smoother running and longer life.

It may, perhaps, be imagined that by using a greater width of wheel face, an increased power can be taken through the gears. This is true only to a limited extent, because as the wheel gets wider, the diameter of the pitch surface at the sides of the teeth gets greater, and as a consequence the pitch is greater. When this increase is very great, the gears cannot mesh properly at those points, and inaccurate meshing, owing to the wheel teeth getting out of pitch, causes considerable friction and rapid wear. This fault often causes the excessive generation of heat. Gears overheated can frequently be remedied by reducing the angle of throat. When this throat angle is not allowed to exceed 70 degs., then the increase in pitch is not sufficient to seriously impair the working of the gears.

Another point to watch is the length of the worm, and if the latter be made of such a length that the ends are clear of the outside diameter of the wheel (at the bottom of the throat radius), there will be no fear of the rattle which is sometimes heard, when the ends of the worm threads strike suddenly into the wheel teeth instead of smoothly sliding into mesh. It has been said that this worm is too long—owing to the law that no tooth contacts can take place out of the line of action. This is all very well for a new pair of gears, but when wear has taken place, matters are slightly altered.

Chart Feature.

With regard to the strength of worm gears, the accompanying chart will serve to solve this problem for bronze worm wheels. Bronze wheels give the most satisfactory results—either solid bronze gears, or cut bronze rings shrunk on cast-iron centres.

To use the chart it is first necessary to assume any worm and wheel to give the reduction required, then proceed to find by the chart if the assumed gear is suitable for the power which it is intended to transmit. If not, the pitch or pitch-line diameter of the worm should be altered until the required power is obtained.

Next calculate the pitch-line velocity of the worm wheel as follows:—

$$\frac{\text{Pitch ins.} \times \text{No. teeth} \times \text{revs. per 10 in.}}{12} = \text{Pitch line velocity in feet per min.}$$

Then find the position on the axis (L M) for the value obtained. Follow this horizontally to the curve in graph (A), down the corresponding ordinate and cross axis (L K) to the line in graph (B), marked with the linear pitch of the worm. Proceed horizontally across (K N) to the line in graph (C), representing the pitch-line diameter of the worm used. The point on the axis (N P) vertically under this will give the horse-power for which the gears are suitable. The method is based on the proposals put forward in this article, and will be found ready and reliable.—Page's Weekly.

STAMPING DIMENSIONS ON SHOP TOOLS.

By James E. Cooley.

THE necessity of stamping dimensions on shop tools can never be realized until one begins to observe how much unnecessary remeasuring is done in handling; how much time is wasted in this way, and how expensive it really is, when we consider the number of employees engaged in this practice. Take for example a planer-hand who, setting up work on a planer, requires a bolt of a certain diameter and length, and a straddle a certain width across the opening. He will pick up several of these parts and measure each one until he finds those wanted. This act of measuring is not confined to one particular job, but is repeated on nearly every job set up, and if the diameter, thread, and length were stamped on the bolt, and on the straddle, the distance across the opening, there would be no need of measuring these tools each time when needed.

When we consider this one little feature, where re-measuring is required, and see not alone one planer-hand, but practically all others employed doing this same thing, and repeating it often in the course of a year, the waste of time begins to assume big proportions. If the time wasted in re-measuring unstamped shop tools by one class of operators is of considerable proportions, how much greater is it when one considers lathe hands, drill press hands and other machine operators doing the same.

A lathe hand requires a new bolt hole in a face-plate on which to strap a piece of work. He drills a hole, taps it out, and is the only one that knows the diameter of hole and pitch of thread. Later on another workman desiring to use the same hole pulls out his scale and measures the size. He finds a bolt the right diameter, but with the wrong pitch of thread. He forces this into the hole and strips the thread, and, of course, a new hole must be drilled and tapped out. Thus it is seen that if the diameter and pitch of thread were stamped on holes in face-plates a good deal of time and expense would be saved. Considerable time is usually required to set up machinery, to arrange fixtures, to strap down parallels, to bolt down angle-plates, etc., but the greater part of this time has been taken up in measuring those parts in use which have been previously used over and over again and measured each time when handled. This routine will continue as long as shop tools remain unstamped or have nothing on them to indicate their size.

A certain manufacturer, referring in a humorous way to one of his employees, said, "that he never saw him doing anything, but he was always getting ready to." This "getting ready to" is the time mostly spent in the needless measuring of tools. If workmen were given drawings to work to, having thereon no dimensions, necessitating the measuring of the parts shown in the sketches, we would think it a peculiar and expensive method of doing work; yet this is exactly what is being done in the way of handling a great many shop tools. It is necessary to measure them in order to find out their thicknesses, widths, diameters, etc., before they can be used.

Rows upon rows of parallels of various thicknesses and widths are kept in order on shelves and racks for use on milling machines and planers, and not one of them can be found containing a mark of any kind to indicate its size. How often is it necessary to run the jaws of a lathe chuck clear out to see if they will take in work of a certain diameter, when the limit of capacity could be just as well stamped on the chuck to save repeating this operation. A careful and systematic study of the various machine tools and appliances that are measured and re-measured each time used will convince anyone that a great saving in time and labor can be effected.

Another point that needs to be mentioned in regard to stamping dimensions on shop tools is the inadequate supply of "sets of figures" noticeable in the average machine shop. Of all supplies kept on hand in stock or tool-room, the least of these are "sets of figures." Taps, drills, files, and all these necessary things are bought in liberal quantities, but not so these "figures." It will, therefore, become necessary in order to make any noticeable reduction in time and labor to keep on hand a sufficient number of "sets of figures," so they can be given out to workmen to use freely in stamping dimensions on tools, and thus eliminate the necessity of re-measuring. No shop tool, fixture, or any machine appliance is finished, and never should be put in use, until its dimensions are stamped on it. A reamed hole or a hole tapped out on an angle-plate should have its size stamped over it, as also every tool or fixture that some time or other will be used over again. Steel figures if liberally used are big time-savers, and occupy a place and distinction as such equal to that of automatic machinery.

HAND-PULL HOIST ATTACHMENT.

By Mac.

TO those interested in lifting material in shops, otherwise than by hand or with chain falls, I will describe the attachment we made to a 4-ton "Harrington" hand-pull chain fall. We used this lift outside our shop for loading and unloading. It ran on a trolley suspended from an 8-inch I beam supported on the building and on an arch 15 feet apart. When first erected, the only means of operating was by man-power, but as the loads were heavy and the weather cold, two or three men would quickly become tired, and the work was carried on slowly.

We had an air compressor in the shop to drive air hammers, drills, etc., and it set me thinking as to how to supply some sort of power to our hoist outside. An idea came to me, and I told the manager we could put a reversible motor on our chain fall and do the work of driving much quicker and cheaper. I explained our need of an air motor, a pinion and gear to try the scheme out. He was much impressed with the idea, having frequently complained of the time it took to do our loading.

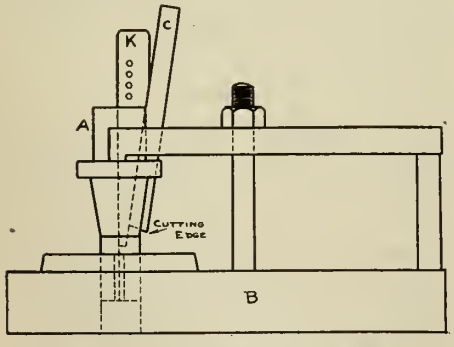
The matter rested for some time; in fact, until an air tool traveler called; they visit us about once a month to keep in touch with the operation of the tools. The manager called me into the office to explain our needs. We went out to the shop and looked the hoist over, but aside from sending us down two small reversing drills or motors to try out, no great encouragement resulted from the interview. The smallest motor, with a speed of 750 r.p.m., was the one we selected to try.

I went to the forge shop, and from a $\frac{3}{8}$-in. x 1-in. flat steel bar made a cradle with two clamps, one to clamp over the stuffing box spindle and the other over the throttle pipe, as it screws into the valve chamber of motor. This cradle I bent and bolted to the chain hoist where the hand chain guide yoke had been. I had taken off the hand sheave yoke, and as the whole arrangement was in the nature of an experiment, I did not want to buy any gears, so I borrowed two of the change gears for thread-cutting from one of the lathes. The pinion had 20 teeth

and the gear had 100 teeth, which gave me a ratio of 5 to 1.

The next problem was to fit the gears to the motor and hoist. I made a short tapered arbor, one end with a No. 2 Morse taper to fit the spindle of the air motor. The other end I turned and splined to fit the pinion, which I pressed and keyed on. I then threaded the bore of the cast iron gear to fit the sleeve on the spindle of the chain hoist. The air motor was next placed in the cradle and clamped tightly with the gears in mesh. After making a clamp yoke to fit the throttle with two long cords attached for operating, we hung the machine up to the shop roof, and tried it.

As the air drill was small and light, we did not expect a great deal, but it handled our heaviest weights without trouble. We then put it outside where it belonged, and connected it with the air-line through a hole in the wall with 25 feet of 1-in. protected rubber hose. We have lifted over three tons with it so far, and have had no trouble, except from the cold, when the valve freezes.



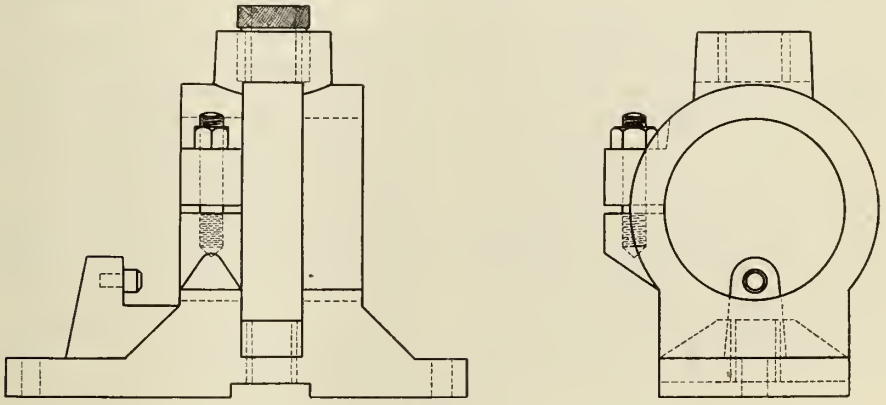
The next time the air tool traveler came he was interested in our hoist, but would not be convinced of its success until he had seen it in operation.

KEYSEATING MAGNETO GEARS.

By A. L. Loy.

IN the Jan. 1 issue of Canadian Machinery, a method was described of keyseating tapered magneto gears by sawing. The writer wishes to describe a different method of doing the same job.

The drawing shows the fixture used, without a gear in place. The base B has a finished pad on which the gear to be keyseated is placed. This pad is also bored out to receive the arbor A, corresponding to the small size of the taper hole. To prevent the arbor from turning, it is keyseated, a stationary key being provided in the base. The arbor is milled full length about half its depth to



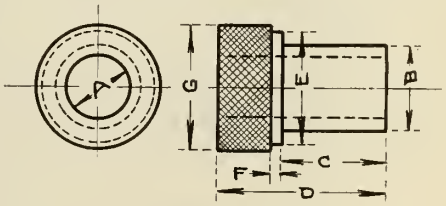
KEYSEATING MAGNETO GEARS.

the same width as that of the key to be cut. A taper wedge, K, having the same taper as the arbor, is provided with a number of small holes in which a pin may be inserted to hold the same in place. The hardened cutter or drift, C, is driven down through the gear hub, the cutting edge being at the lower corner. After the first cut is taken, the tapered wedge is lowered a hole, and the cutter again driven through. About three cuts is sufficient for the ordinary gear, and it is surely surprising how quickly the operation may be performed. The clamp at the top holds the arbor firmly in the gear, at the same time clamping the gear to the base.

A PISTON CROSS-BORING JIG.

By D. S. Mann.

IN cross-boring gas engine pistons several different types of jigs are used, depending in many cases whether the cross-boring is the first or the final operation, and also whether the bosses are to be faced or not. In some cases box jigs are used, the piston being located by the open end; in others, an open type of jig is used, the piston being located in the same manner.



PISTON CROSS-BORING JIG.

The jig shown in the drawing is of the open type, but since the cross-boring is the final operation and the piston has already been ground to size, it is held and located by the circumference. The jig comprises a single casting which is bored out to receive the piston, the part holding the piston consisting really of two rings across which on the top is a bushing provided for guiding the boring bars, while beneath is placed another bushing. Sufficient space is left between the upper bushing and the top of the piston so that the slip bushing will be down into place before the boring cutter enters the piston.

One of the body rings is split and used for clamping the piston, this being done back of the bosses on the closed end where the metal is thickest. The pistons are pushed into the jig, the closed ends striking the hardened steel stop pin which is placed the proper distance from the cross-boring. Pistons should always be located from the closed end in order to maintain the compression pressure constant when in the engine cylinder. In this particular case, the pistons had previously been rough-drilled and, when inserted in the jig, a tapered plug was pushed down through the upper fixed bushing centering the piston sufficiently close.

A double-cutter boring bar piloted in the lower bushing was first run through the pistons, the slip bushing shown in the drawing being used on the upper end. This was kept on the bar and was removed with the bar, the upper cutter lifting out same. A double reamer also carrying a similar slip bushing and piloted in the lower bushing was then run through for finishing. It should be stated that the holes in the sides of the pistons were not the same diameter, one being 1½ inches, the other 1⅝ inches. This enabled the cutter for the lower part of the piston to be slipped through the upper hole so that the feed of the bar was only that of the one hole. After the holes were reamed to size the bosses were faced, the cutter bar fitting the two previously reamed

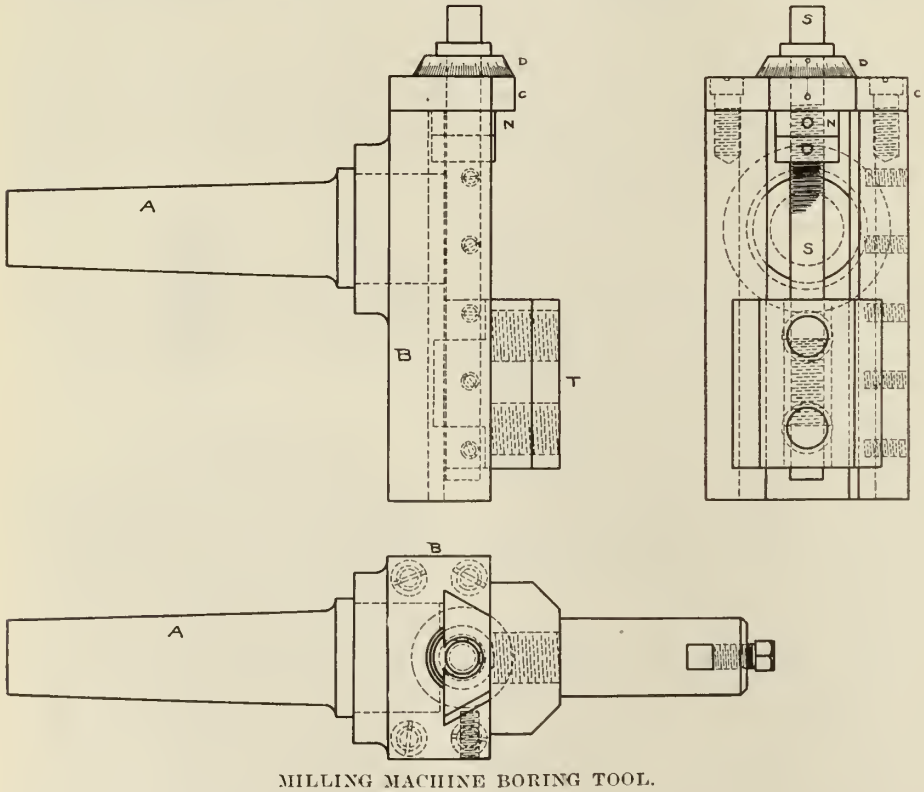
SLIP BUSHINGS FOR PISTON CROSS-BORING JIGS.

holes with deep chip grooves milled in that portion of the bar which acted as a guide.

This style of a jig leaves the open end of the piston entirely free so that it is easy to insert the facing cutter and also to do any calipering necessary. The facing cutter was ground on both the upper and lower edges and, in use, stop collars were provided on the bar and the lower bosses faced accordingly, the proper spacing between the bosses being obtained by calipering. A felt washer was used on the lower end of the boring bars to prevent the chips working into the bushing.



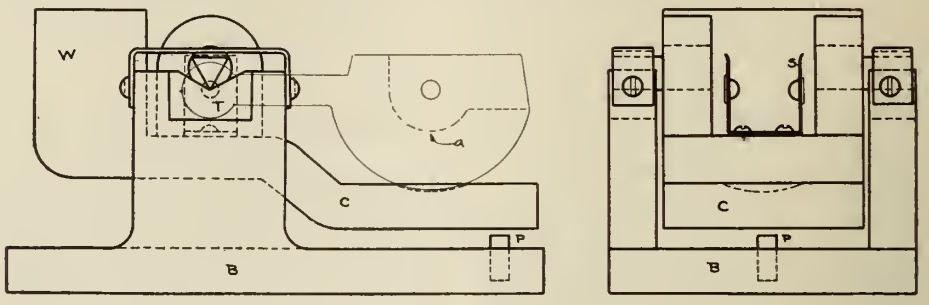
MILLING MACHINE BORING TOOL.

By D. O. Barrett.

THE accompanying drawing shows a very useful type of tool for boring on a milling machine. In the size shown, the taper of the shank was a No. 10 Brown & Sharpe. The shank A of the tool extends through the body B, which is bored out to receive same, and is then shrunk on. All parts of the tool are of steel. The body B is beveled out to take the tool holder T, which is provided with a gib on the one side, backed up and adjusted by the five headless set screws at the side. These screws are adjusted so that the block T is a neat fit in the body, and no clamping is then necessary.

The screw S is one-half inch in diameter, having twenty threads per inch. This extends through the end piece C, which is fastened to the body B by means of the four filister head cap screws. The dial D is graduated into fifty parts, which graduations will, therefore, read in thousandths of an inch. The two nuts N are used for taking up the end motion on the screw, and are each provided with holes in which pins may be inserted for turning. The outer end of the screw is squared so that a small wrench may be used on same.

The nut in the tool holder T does not extend the full length of the block, and the block may be readily removed by screwing entirely out. This block has two ¾-inch tapped holes, one at either end, in which bars are screwed and the cutting tool held in the end of same. In boring small holes, the bar is used in the inner hole, while for larger holes it is used in the outer hole. Bars of different lengths may be used, so that the range of the tool is quite large. With the tool shown, holes up to 9 inches in diameter may be readily bored.



MILLING MACHINE BORING TOOL.

This holder is very solid, and its range quite large for its size, while the adjustments are easily made and extend over the entire range.

A GOVERNOR BALL-BALANCING FIXTURE.

By A. L. Loy.

THE fixture shown was used for balancing governor balls used on the governor of an oil engine. The ball is shown in the side view in the light line, and the desire was not so much to maintain the ball of a standard weight as to get all the balls on the governor of the same weight, there being three to each governor; and to prevent unequal stress, each of these should be of the same weight as the others.

GOVERNOR BALL BALANCING FIXTURE.

The base B carries two side pieces, in which are set the tool steel blocks T. Resting in these are the hardened knife edges which support the block C, in which the governor ball is laid. Riveted to the piece C is the heavy spring S, in which are two round-head hardened rivets, with the heads on the inside. These heads are located on the centre line of the knife edges, and the end of the governor ball is pressed down into the spring; these two rivets fitting in the already drilled hole. The large end of the ball rests in the depression. The weight W is arranged to balance the ball, the proper weight being obtained by drilling out. In order to maintain the balls uniform, a standard weight was made and retained for checking up the device at any time. The balls were made slightly heavier, and then drilled out at the point (a), the pin P taking the pressure of the drilling.

The Dominion Forged Steel Car Wheel Co., of Ottawa, which holds the patents for the manufacture of forged steel car wheels, is being organized with a capital of $1,000,000. The company is financed by English capital, and Mr. Dugald Ross, of Toronto, is making arrangements for the establishment of the plant here. The plant, according to present plans, will work up to a maximum requirement of 200 tons of steel per day. The company will employ between 75 and 100 men, and their annual pay roll will be in the neighborhood of $200,000.

Series of Practical Questions and Answers for Mechanics

Every care is being taken to include only pertinent practical questions, and give same direct, reliable answers. Catch questions will be avoided. Attention is drawn to the alternating course in arithmetic, a concurrent study of which is recommended with that of the Question and Answer Series.

PROBLEMS IN CENTRIFUGAL FORCE.

CENTRIFUGAL Force is the force which tends to move a body away from the centre about which it rotates. It is caused by the tendency of a body to move in a straight line rather than in a circle.

The formula for centrifugal force is

$$F = \frac{mv^2}{R}$$

In which m = the mass of the revolving body.

v = the velocity of its centre of gravity in feet per second.

R = radius = the distance between the centre of gravity of the body and the centre of motion.

For pulleys and other parts of machinery, this formula is best simplified so that we can use r.p.m. instead of ft. per sec., and weight in pounds instead of mass.

$$m = \text{mass} = \frac{W}{g}$$

where W = total weight of body in pounds.

g = value of the force of gravity = 32.16.

$$N = \frac{60v}{2 \times 3.1416 \times R},$$

there being 60 seconds in one minute, and the circumference of a circle = 3.1416 × 2 × radius. N=r.p.m.

Combining these values, from

$$F = \frac{m}{R}v^2, \text{ we get } F = \frac{W}{gR}\left\{\frac{2 \times 3.1416 \times R \times N}{60}\right\}^2 = .00034WRN,^2$$

which is a more workable form of the formula for most purposes, and in which

W=weight of the rotating body in pounds.

R=radius of motion.

N=revolutions per minute.

Question.—What would be the total centrifugal force developed in a cast iron flywheel whose outer diameter is 5 ft. 3 in.; thickness of rim, 3 in.; width of face 12 in., and speed 190 r.p.m.?

Answer.—It is usual to consider the rim only in such cases, therefore number of cubic inches of iron in rim = cross section area × mean circumference = (3×12)×(5×12×3.1416).

Weight=6785.8×.26=1764.32 pounds.

Using formula $F = .00034WRN^2$,

$F = .00034 \times 1764.32 \times 2.5 \times 190 \times 190 = 54{,}138.16$ pounds, which is the total centrifugal force tending to separate the rim from the hub.

* * *

Question.—If a ten-foot pulley were one pound out of balance, at what speed would it have to be run in order to make the unbalanced centrifugal force equal to a ton?

Answer.—Using the formula $F = .00034WRN^2$, we desire to find N, therefore

$$N^2 = \frac{F}{.00034WR} \text{ or } N = \sqrt{\frac{F}{.00034WR}}$$

Substituting values,

$$N = \sqrt{\frac{2000}{.00034 \times 1 \times 5}} = \sqrt{1176470} =$$

1080 revolutions per minute. That is, at 1,080 r.p.m., the pulley would be a ton out of balance.

* * *

Question.—The Quebec bridge will weigh when completed approximately 65,000 tons. What would you expect it to weigh if the earth ceased to rotate and there was no centrifugal force?

Answer.—Formula, $F=.00034WRN^2$.

W=65,000 tons=65,000×2,000 lbs.

R=4,000 miles=4000×5,280 ft.

N=1 revolution per day = $\frac{1}{24 \times 60}$ revolutions per minute.

Therefore,

$$F = \frac{.00034 \times 65{,}000 \times 2000 \times 4000 \times 5280}{24 \times 60 \times 24 \times 60} =$$

450,185.3 pounds = 225.1 tons; or, if it were not for this force, the bridge would weigh 65,000+225.1=65,225.1 tons.

* * *

Question.—The governor weight of an automatic cut-off engine weighs 120 lbs., and its working position is 9 inches from the outside edge of a 4-ft. wheel. The action of the weight is directly resisted by a coiled spring. If the speed be 280 r.p.m., and friction be neglected, what will be the tension of the spring?

Answer.—Formula:

$F=.00034 \times WRN^2$.

R=2 ft.—9 in.=1¼= $\frac{5}{4}$ feet,

$$\text{or } F = .00034 \times 120 \times \frac{5}{4} \times 280 \times 280$$

=799.68 pounds.

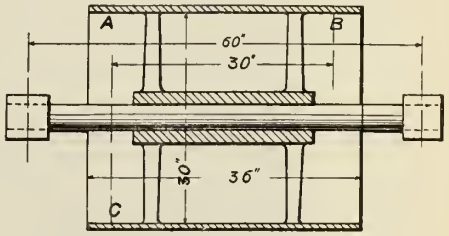
Question.—If a car weighing 30,000 lbs. went round a curve of 60-ft. radius at the rate of fifteen miles per hour, what would be the force tending to throw the car off the track?

Answer. — The original formula $F = \frac{mv^2}{R}$ is most convenient in this case.

$$m = \frac{\text{weight}}{\text{force of gravity}} = \frac{30000}{32.16}$$

$$v = 15 \text{ miles per hour} = \frac{15 \times 5280}{60 \times 60} = 22$$

ft. per sec.



R = 60 ft., therefore,

$$F = \frac{30{,}000}{32.16} \times \frac{22 \times 22}{60} = 7524.8 \text{ pounds,}$$

or 3.76 tons.

* * *

Question.—An idler pulley of 36-in. face and 31-in. diameter, with rim 1-in. thick, is two pounds out of balance on account of a lump at C in the cut. The man who balanced the pulley attempted to correct this by putting a two-pound weight upon the opposite side of the pulley at B, instead of at A as he should have done. Considering the weights 30 in. apart and the bearings 60 in. apart, what would be the force on each bearing due to the wobble of the pulley when running at 1,000 r.p.m.?

PROBLEM IN CENTRIFUGAL FORCE.

Answer.—For one bearing, centrifugal force due to 2 lbs.= $F = .00034\ WRN^2$.

W = 2, $R = \frac{15}{12}$ ft., N = 1000.

$$F = .00034 \times 2 \times \frac{15}{12} \times 1000 \times 1000 = 850$$

pounds.

This acts at a point 15 in. from the centre of the bearing, and the shaft being pivoted at the other bearing, the force on the bearing would be $\frac{850 \times 45}{60} =$

637.5 pounds.

Question.—A cast iron pulley has a rim 12 in. wide and 1 in. thick. Its outside diameter is 12 ft. 1 in. Neglecting the effect of the arms, at what speed would it be likely to burst?

Answer.—Formula, $F = .00034\ WRN^2$,

$$\text{or } N = \sqrt{\frac{.00034 \times W \times R}{F}}$$

The force necessary to separate the wheel in halves would be the force necessary to break the rim in two places. This would be twice the sectional area multiplied by the tensile strength of cast iron, and is, therefore,

$2 \times 12 \times 1 \times 15000 = 360{,}000$ pounds,

which must be that part of the centrifugal force which acts at right angles to any diameter.

The centrifugal force necessary would be $360{,}000 \times 2 \times \frac{3.1416}{2} = 360{,}000 \times 2 \times 1.5708$

$F = 1{,}130{,}976$ pounds.

1.5708 = relation of diameter to ½ circumference.

Volume $= 12 \times 1 \times 3.1416 \times 12 \times 12 = 5428.5$ cub in.

Cast iron weighs .26 pound per cub. in., therefore weight $= 5428.5 \times .26 = 1411.5$ pounds.

Now $N^2 = \frac{1130976}{.00034 \times 1411.5 \times 6} = 392700$,

or

$N = \sqrt{392700} = 626.6$ r.p.m.

* * *

Question.—In the previous question, if a piece weighing 200 lb. flew off, what would be its kinetic energy?

Answer.—Speed in feet per minute = circumference multiplied by r.p.m.=

$12 \times 3.1416 \times 626.6 = 23{,}617.8$ ft. per min. $= \frac{23{,}617.8}{60} = 393.63$ ft. per sec.

Formula for kinetic energy is,

energy $= \frac{1}{2}mv^2$, or in other words,

energy $= \frac{Wv^2}{2g}$ where

W = weight in pounds = 200.

v = velocity in ft. per sec.=393.63

g = force of gravity = 32.16, or

$\frac{200 \times 393.63 \times 393.63}{32.16 \times 2} = 481.803$ pounds,

which is the kinetic energy.

BALL TURNING ATTACHMENT FOR DRILL PRESS.

By H. Womersley.

FIG. 1 shows the assembled arrangement of a fixture and tools for turning governor balls in the drill press, and thus relieving the lathe. The most rigid drill in the shop was chosen for the purpose, as freedom from lost motion in the spindle is essential to its success.

The base A is made of cast iron to which the brackets B and C are fitted, the former supporting the worm D upon

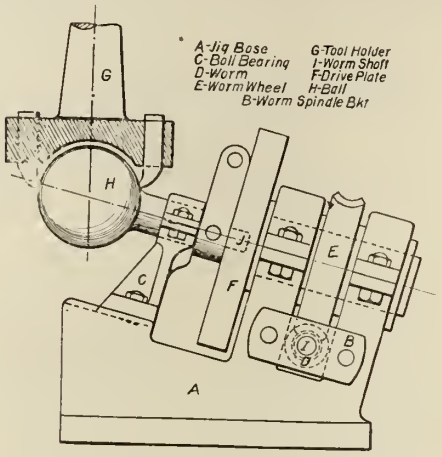


FIG. 1.—BALL TURNING FIXTURE.

the spindle I. A worm gear E is driven by worm D. The bracket C should support the work as close up as possible without interfering with the operation of the cutters. This bracket is also equipped with different bushings to accommodate ball shanks of various sizes. A small clamp fastens the ball to the driving plate F and the work is centred by the small projection J which is cut off when the job is finished.

The work is shown at T, Fig. 2, and the tool holder at S in the same figure. It is easily seen that, as the ball is revolved by means of a ratchet wheel or other means, attached to the worm

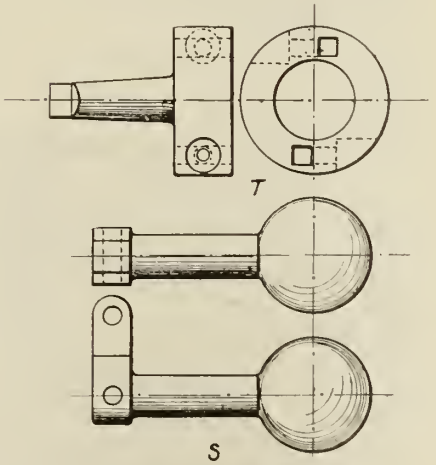

FIG. 2.—WORK AND TOOL.

spindle, the cutters will reach every part of it and the result will be a true sphere. The balls are first centred in a small lathe and the parts J and the shanks are turned by an apprentice. They are then taken to the drill where the balls are turned. The finishing touches are put on in the speed lathe where the work is polished.

A MEANS TO AN END.

By Armley Leeds.

UPON assuming the management of a machine shop engaged in a large general business, I was particularly struck with the inconsistencies in the times allowed for certain pieces of work. The bonus system as it was employed was not fully satisfactory, but I came to the conclusion that its chief weakness lay in the wrong adjustment of time allowances. The times apportioned by my predecessor to machining the different parts of governors seemed particularly unreasonable to me, but that allotted for turning the balls went to the limit in this respect, so I decided to begin here with my reforms. The trades union element in the plant was strong and seemed to devote itself to maintaining the time allowances as large as possible, which made any readjustment particularly difficult.

The turning was being done in a radial feed motion arrangement attached to the gantry and could be applied to only one lathe. I approached the turner and pointed out to him that the job was taking too much time, basing my assertion upon the available cutting speeds and feeds of the machine and tools. He replied that he was perfectly willing to let any other lathe man in the shop have a try as he was confident that the time could not be reduced. This was of course impossible, for the other men knowing the actual and allowed times would see that these were not lowered. I therefore proposed that I should do a few myself and that my speed should set the pace for the job. This he would, on no account, agree to.

I was determined to gain the point, however, so I arranged for a little competition by constructing an arrangement to do the work on the drilling machine. This plan proved most successful. After turning a few in this way, the job was put back temporarily on the lathe with the result that the turning time came down from 52 to 32 hours. It has also added considerable flexibility to the job by making it applicable to either of two machines that happens to be idle, the advantage of which, every foreman knows.

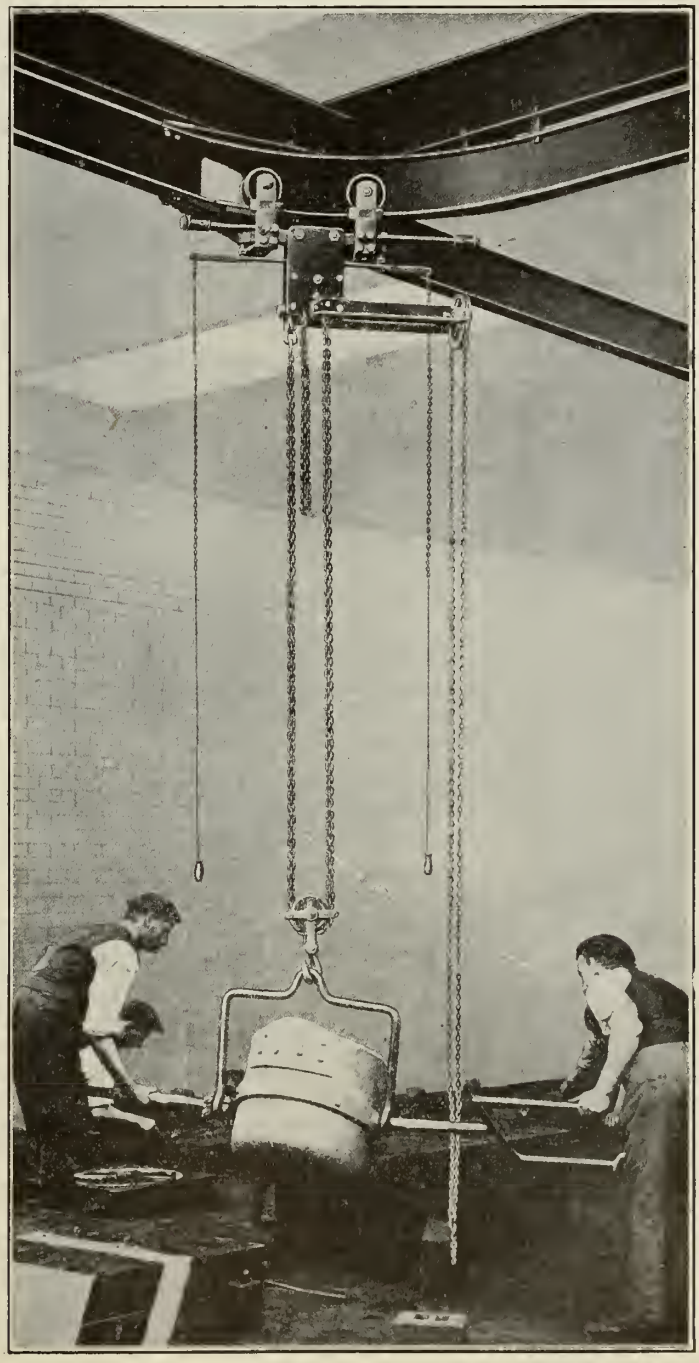
I have read a great many articles and books dealing with scientific management, but I still find that a little judicious competition will solve many problems still unraveled by the advocates of these systems.

When starting up a boiler that has been dead, raise steam slowly, drop the pressure a few pounds on remaining boilers in the battery, and do not open the stop valve until the gauge on the dead boiler shows the same pressure as the other boilers.

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

CONVEYING MOLTEN METAL.



THE constant grind of competition is gradually but surely eliminating from the foundry many of the methods that were considered good enough by our forefathers, and this applies particularly to the ways and means for moving materials and equipment from point to point as required. Pig iron, coke, and sand have to be brought in, patterns, cores, and flasks have to be taken to their appointed places, and, most important of all, the hot metal has to be carried to the moulds, and, finally, the castings have to be removed to the cleaning shed.

When foundries were small and compact, a good old-fashioned timber-frame jib crane was all-sufficient for distributing molten metal from the cupola to the moulds grouped conveniently around it, but as the use of cast-iron grew, the size of the foundry floor was necessarily increased, and the jib crane as a means of transportation was displaced by a hand or electrically operated overhead traveling crane, which covers the whole area of the moulding bed. However, even the overhead traveling crane has its limitations. The best and most modern electric cranes can only handle one full ladle at a time, and it must return each time to the cupola to replenish, thus forcing the men to wait their turn for the metal. This is frequently a source of confusion as well as a waste of time and material.

The overhead track was next evolved to enable each man to serve himself. The track at first consisted of a simple flat steel bar, with a little trolley running on the top, and crude switches were fastened to connect up the sections of track and allow the trolleys to run all over the system; but the combination of rough-and-ready construction with foreign, uneducated help, resulted in frequent and in some cases fatal accidents, which inevitably cast discredit on the whole principle of overhead tracks.

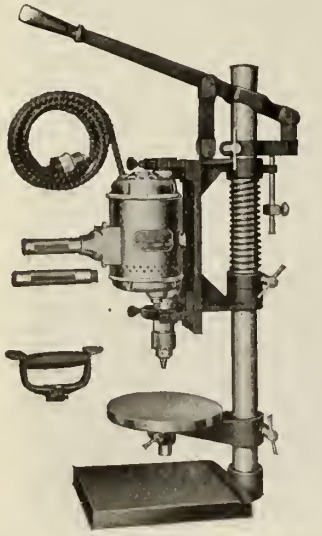
Our illustration depicts the Morris Q.E.F. Junction, the feature of which is that it has no moving parts. It is always "set," no matter in which direction the trolley is required to run. The switch has no "open ends" from which it is possible for a headstrong man to run off a trolley carrying a ton of molten metal, in spite of carefully devised "automatic stops."

The steering gear of the Morris trolley being on the trolley itself, the operator is thus able to determine the direction which the latter will take long before he arrives at the switch, and, what is even more important, without even retarding the motion of the trolley in order to take the turn. Each trolley possesses eight dust-proof ball bearings, and will carry a big bull-ladle full of iron at a quick run, so that the metal may be carried if necessary a couple of hundred yards from the cupola and still arrive at the mould in good condition for pouring.

CONVEYING MOLTEN METAL.

Another interesting feature of the Morris traveling chain-block is clearly shown in the half-tone. The operating chain of the lifting gear is extended to one side, so as to fall quite clear of the

ladle, thus keeping cool for the users' hands, and preventing that sudden disappearance which inevitably follows when a pure iron chain is dipped into molten metal.



The Canadian Westinghouse Co., Hamilton, Ont., is at present installing a runway on this principle, of 1½ tons capacity, and we hope before long to be able to put before our readers some particulars of this installation.

COMBINATION HAND DRILL AND SENSITIVE DRILLING STAND.

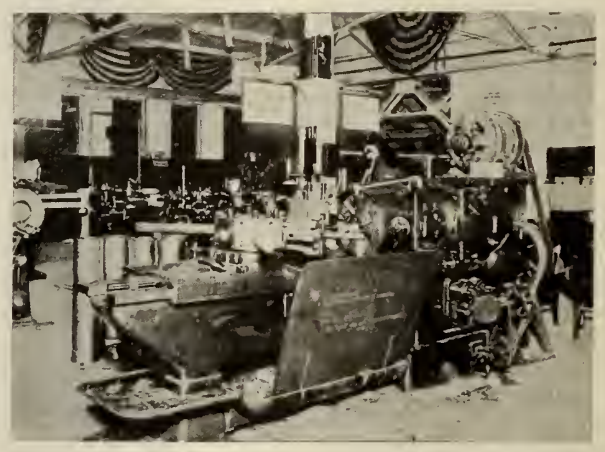
WE herewith illustrate a new machine recently brought out by the Cincinnati Electrical Tool Co., Cincinnati, Ohio. It is a combination of their portable electric hand drill and a sensitive drilling stand. The hand drill can be used independently of the stand or as a sensitive bench drill, giving two tools in one. The hand drill is inserted or detached in a few seconds by means of the thumb nuts releasing the hinged caps, which lock it in the bracket.

The bracket has a 3-in. feed on the column, with quick return, and is operated by the hand lever. It has a vertical adjustment through the clamping screws on the column, and can be set at any desired point. A stop on the column regulates the depth of the holes to be drilled. When not required, the table, which is 8 inches in diameter, can be turned aside. The drilling stand is made for drills of ¼, ⅜ and ½ in., and weighs 60 lbs. The column is 30 in. high and the distance from it to the centre of the table is 5 inches.

This combination will be found particularly useful for shops where both outside drilling and bench drilling is

COMBINATION HAND DRILL AND SENSITIVE DRILLING STAND.

to be done, and where one of these two classes of work is only occasionally done. The machine can be set anywhere and is built in its entirety by the Cincinnati Electrical Tool Co.



ONE HOUR'S LATHE WORK IN 7½ MINUTES.

THE lathe shown in the illustration was exhibited at the Foundry and Machine Exposition at Chicago last October, and, while there, was shown working on dropped forged gear blanks, 8½ inches in diameter. The following results were obtained many times:—

Rough and finish boring, 5½ minutes.

Rough and finish turning, and facing on rim and hub, 2 minutes.

Total time, 7½ minutes for a job that is generally admitted to be a good hour's work for an engine lathe.

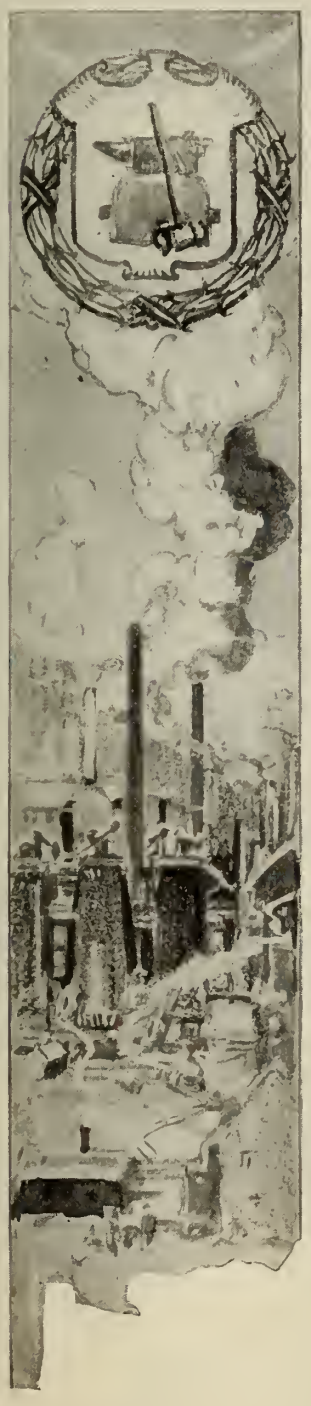
ONE HOUR'S LATHE WORK IN 7½ MINUTES.

This lathe is an 18-inch Libbey turret lathe manufactured by the International Machine Tool Co., Indianapolis, Ind. Its makers claim that its rapid production is due to the great power developed, the strength and stiffness of all parts, and the convenience of operation. The entire control of the machine is concentrated for the operator, and is so designed that the actual manual labor required of him is reduced to a minimum; he is, therefore, offered every inducement to push the machine to its capacity.

It is driven by a Westinghouse Electric alternating-current constant speed motor. The speed changes are effected through a sliding pinion and two double frictions are so arranged that the operator can stop his machine in the midst of a heavy cut and pick it up instantly under feed. Eight steps are provided, giving speeds ranging from 8 to 300 r.p.m.

Y. M. C. A. AIMS TO LESSEN NUMBER OF MISFITS.

A NEW feature of special importance in the organization of the Vocational Department has just been added to the work of the Central branch of the Toronto Young Men's Christian Association. The function of the Vocational Department is to assist boys in the choice of their life work, and is headed by an exceptionally strong executive committee and an advisory council of more than a hundred prominent business and professional men. The project has been unanimously indorsed by the Board of Education, which has placed at the disposal of the committee any assistance which can be given by the principals of the schools and other members of the staff to aid the carrying on of the work.



In organizing the department, the officials were actuated by the knowledge that so many boys, after their school days, are thrown upon their own resources. Without proper guidance many drift into work for which they are not fitted, thus lessening their chances of success. With the assistance of the advisory councillors, the Y. M. C. A. proposes to lessen the number of misfits.

Clearing-House for Boys.

The association will also undertake to have addresses given from time to time to groups of boys desiring to enter certain spheres of business, such addresses being given by men prominent in their particular lines. It will also assume the nature of a clearing-house for boys leaving school, and will be of material assistance to manufacturers and business men by placing the right kind of boys in their hands. The department will deal not only with boys leaving school, but also with older boys who are already at work, and also with young men attending the university.

The executive committee is as follows: Chairman, Dr. Jas. L. Hughes; W. P. Gundy, President Board of Trade; Dr. Fred. J. Conboy, Board of Education; Controller James Simpsin, Secretary and Manager Labor Temple Co., Limited; John A. Tory, Supervisor Sun Life Insurance Co.; Dr. A. H. Abbott, University of Toronto; G. A. Warburton, General Secretary Y. M. C. A.; J. P. Hagerman, Boy's Secretary Y. M. C. A.; Department Secretary, E. F. Trimble.

Efficiency of the Individual

By GEO. H. SHEPARD

Illustrated by A. LISMER

AN Englishman once said that the American business man leads a life of intense activity. He rushes to his office, after a hasty breakfast, reading the morning newspaper at the table or in the car, for lack of time to read it otherwise. He opens his mail, reads it hurriedly, and dictates the replies. He snatches a quick lunch in ten or fifteen minutes or goes hungry. He posts off to another part of town, attends a business meeting or two, meets representatives of several other concerns, hurries back to his office, reads and signs his mail, and hurries away to an evening meeting. Said the Englishman, "He has not been idle fifteen minutes all day, and he has not thought fifteen minutes about anything."

Such strenuous, intense, driven lives fill early graves and recruit the mad-houses, while they show little in the way of achievement in comparison to their enormous outlay of energy.

In exceptional cases men of unusual endurance drive themselves like steam engines and attain wonderful success; but there are at least well known instances where men of that type, in the physical slump that comes to men in later middle life, have gone down completely.

For the hurried, driven, and overworked there is relief.

The effects of the application of the principles of efficiency in industry are well known. As a general average based on American practice, the possible results may be roughly stated as a thirty per cent. reduction of unit costs, excluding materials.

These economies are the sum of detail results throughout the business, of savings of the time of this worker, of the labor of that one, of reduction of waste of material on this article, of economy of power on that machine, of reduction of idle capital here, of effective use of waste room there.

These economies of time, labor, and money in a business are, after all, obtained only as the sum of such results in the cases of many of the persons in its service.

It is proposed, in these articles, to apply the lessons of industry for the benefit of individuals.

Results are obtained by the application of a few definite principles, as follows:

Ideals; personnel, scientifically selected and organized; higher common sense; discipline; fair deal; standards; conditions and work adapted to each other; doing things the best way; instruction; planning; despatching; immediate, adequate, and reliable records; efficiency reward.

I should advise any one who wants to increase his personal efficiency to begin by memorizing thoroughly the above list of principles. They should be learned so thoroughly that they become subconscious, that is, so that it becomes second nature to apply them without conscious thought, just as one walks without any attention to what his legs are doing.

The rest of this series will be devoted to an explanation of every principle in turn in its application to the individual. As the meaning of a principle becomes plain, it should be put into personal application. As soon as a violation of a principle is recognized, it should be corrected. By so doing the application of the principles will become habitual and subconscious.

IDEALS

It is desirable to set forth some ideal which will be universally accepted.

The most civilized philosopher, the most ignorant savage; the ascetic religious devotee, the gay votary of pleasure; the busy man of affairs, the dawdling idler; the gentlest woman, the most hardened criminal; all have one ideal in common. Each in his own way and according to his own light, desires and seeks happiness.

I would, therefore, set forth happiness as the supreme and all-inclusive ideal for the individual.

We are so made that we find happiness permanently only in altruistic service. This is a law of nature against which we rebel, but to whose obedience we are driven back by those severe penalties which nature visits upon all violations of her laws.

Let a man adopt any egoistic ideal and his efficiency, though it may be great in quantity, becomes negative in sign.

Like the ancient Hebrew king who gathered silver and gold and all delights, so that he was great and increased more than all that were before him, but who gave himself successively to the ideals of pleasure, of greatness, of wealth, and finally even of wisdom; for him shall be the cry:

"Vanity of vanities, all is vanity. What profit hath a man of all his labor which he taketh under the sun? . . . . Therefore I hated life; because the work that is wrought under the sun is grievous unto me; for all is vanity and vexation of spirit."

Most happily, in late adolescence develop both the altruistic feelings and the attraction between the sexes. The natural result of the latter is marriage and family life and cares, in which one's altruism finds immediate and stimulating exercise, and in which most of us find the only real happiness that we ever know.

The happy result of the altruism into which nature, before we realize what she is about, thus forces us, sets forth as a corollary to the proposition that happiness is our supreme ideal, that the immediate secondary ideal is altruistic service, even though one's circumstances may limit his practical application of that ideal to the support of his own family.

The ideal of service includes all other right ethical ideals. "Thou shalt love the Lord thy God with all thy heart, and with all thy soul, and with all thy mind. This is the first and great commandment. And the second is like unto it. Thou shalt love thy

neighbor as thyself. On these two commandments hang all the law and the prophets."

As a principle of efficiency, a secondary meaning of the ideal is a definite purpose which must be pursued resolutely, courageously, and without hesitation or vacillation.

The man without a purpose is a drifting derelict, useless to himself and a menace to others. The man who resolutely follows a set purpose is the ship with the strong hand on the tiller and the eye of the helmsman on the compass.

In all history there is hardly a more pathetic figure than Columbus, dominated by his ideal of sailing westward to India, going from court to court seeking a backer for his enterprise, for years meeting only discouragement and rebuffs, but always pursuing his ideal. What a reward was his when, first of all the watching companies of his three ships, he at night saw lights ahead on the shores of the New World, and felt that his ideal has been attained! Nor was the world wholly ungrateful. Today, sainted by the Roman church, the first of a ducal family, honored annually by a great republic, the name of Columbus is a monument to the fact that even one's fellow-men give their rewards to the man who chooses a noble ideal and unswervingly pursues it.

In even the smallest detail of one's work, the first requisite is a clear idea of what is to be accomplished and then a concentration of effort upon it.

Lack of purpose is the cause of innumerable failures. The ordinary man goes to work at the end of his school days with no idea of the kind of life for which he is fitted and with no definite ideal beyond the weekly pay envelope. Work assigned to him by his superiors he does indifferently because he sees beyond it no inspiring ideal. He is through life an opportunist and a failure.

If any course of action is itself incorrect, the determined pursuit of it is mere obstinacy, and is certain to lead to failure.

This illustrates the general truth that the application of any one of the principles of efficiency may be abused into a vice.

DEVELOPMENTS IN COMMERCIAL MOTOR VEHICLES.

By Thomas Clarkson, M.Inst.C.E.

IN a paper read recently before the Institution of Civil Engineers, of which what follows is an abstract, the author said that during the period which has elapsed since the subject of motor-vehicles was last reviewed before the Institution, remarkable developments have taken place in this department of engineering, both in regard to the quality of the vehicles, and in the magnitude of their operations for the transport of passengers and merchandise.

Greater facilities for the transport of passengers in cities are constantly in demand. Electric rail-motors, both on the surface and underground, have met this demand to some extent; but the motor-bus has demonstrated its superiority over the rail-car or tram.

Complete flexibility is obviously impossible in motors dependent upon an extraneous power station; the vehicles must be self-contained, and the power generated from within. The author regards flexibility as the key to the successful solution of the street traffic problem in cities.

Power Generation Feature.

There are at present three methods of generating power for commercial motor transport; namely, by internal-combustion engines, by steam engines, and by electric motors. Each of these methods has found a fairly clearly-defined field of utility. The internal-combustion motor far outnumbers the other types of motor for net loads up to 3 tons, but for heavier duty than this, the steam-motor continues to hold the field.

The rise in the price of petrol has directed attention to other liquid fuels for the internal-combustion motor, and the steam-motor using solid fuel is being adapted for loads less than 3 tons, with the object of checking the ever-growing demand for motor spirit. The electric vehicle supplied with energy by a storage battery has made remarkably little progress.

Fuel.

The petrol motor is confined to the employment of a volatile liquid fuel, while the steam motor may use either liquid or solid fuels. The relative cost of the two systems for fuel per mile is, of course, governed by the ratio between the cost per pound of fuel and the mileage per pound.

The fuel cost for a 3-ton petrol commercial vehicle, with petrol at 32 cents per gallon, and at 8 miles per gallon, works out at 4 cents per car mile. The London petrol bus, which may be taken as equivalent to the 3-ton commercial vehicle, costs about 2 cents per car mile for fuel. This lower fuel cost, it should be explained, is not due to superior engine efficiency, but is the result of an exceptionally favorable contract for the purchase of petrol in very large quantities. The present cost of fuel for London petrol buses is, therefore, abnormal from the point of view of the ordinary user of petrol commercial vehicles.

The steam omnibus at present costs for liquid fuel 3¾ cents per mile, which is a little less than the cost of the ordinary petrol 3-ton vehicle, while the steam omnibus, or 3-ton lorry, using coke, costs for fuel one cent per mile, with coke at $4.60 per long ton.

The significance of this economy, and the real value of an apparently small reduction in cost per mile, is indicated by the fact that a cent per mile represents, approximately, $972,000 per annum on the cost of running London omnibuses.

With regard to the relative reliability of petrol and steam cars, it has been demonstrated conclusively that, with either type of motor, the mileage lost from mechanical causes is extremely small, even when performing a commercial duty involving an annual mileage of 30,000 miles and more per vehicle.

Cost of Upkeep.

As regards the cost of mechanical upkeep, there does not appear to be any reason for a material difference between the two systems under this heading when they are run under similar conditions of management. The light steam 3-ton vehicle using coke as fuel may be regarded as combining the speed and handiness of the petrol motor, with a fuel cost equivalent to petrol at 8 cents per gallon.

The paper gave details of the construction of present types of both steam and petrol omnibuses, and dealt particularly with modern methods of omnibus illumination, while the important question of the construction of road wheels, most suitable for commercial motors of from 30 cwt. to 3 tons' capacity, was also dealt with.

The present position of the electric commercial vehicle was considered in relation to other types of motor, particularly with reference to the investigations of working costs which have been recently conducted by the Massachusetts Institute of Technology, and concluded with a reference to modern steam motor-wagons and tractors.

GREATER EFFICIENCY IN FACTORY AND OFFICE.

THAT greater efficiency in all departments of manufacturing and mercantile organizations is being sought after more than ever before is evinced by the fact that an executives club has been organized in Detroit, one of the greatest manufacturing centres in the United States, for the purpose of determining how the efficiency of Detroit organizations can be materially increased.

The instigator of this worthy movement is Mr. E. St. Elmo Lewis, one of the big men connected with the Burroughs Adding Machine Co. In all of Mr. Lewis's speeches and in all the books he has written on a great variety of subjects, he drives home the urgent need for greater efficiency in factory,

store, and office. He is perhaps the best informed man on the question of efficiency in the United States. His book, "The New Gospel of Efficiency," is looked upon by officials of large corporations and business men in general as one of the best ever written on the subject of efficiency; therefore, with such a man as president, the Executives Club is destined to become a powerful and useful organization.

The club is at present in its formative stage, but ultimately it will be composed of fifty members of as many different organizations in Detroit. It is not an organization which anyone can join on their own initiative. Only those men are invited to join who are of the kind that will bring something of value to the organization, and who will devote thought and time to the propaganda. There are no regular dues, each member being assessed a proportionate amount to cover the budget.

Club Objects.

The primary object of the club is to study efficiency, scientific management, welfare work, methods of employment, etc., and one subject at a time will be taken up. Exhaustive researches will be made in factories, not only in Detroit, but in other cities of the United States and Canada. Theories will not be accepted. The members will seek for cold, hard facts, and in their search for information they will employ a paid investigator. This man will be under instructions to gather his data from real experiences in any branch of the work he investigates.

Plans are now being made for a series of twelve or fifteen lectures to be given this fall on different efficiencies, such as those in the sales department, production, management, office, etc. In each case where a lecture is to be given the men interested in that lecture, who are employed by the members, will be invited to attend at the expense of the firm represented in the Executives Club.

An efficiency propaganda cannot be carried on successfully by any one firm or individual, nor by any club. The study of efficient methods and management must be carried further. Managers of plants must know about successful methods used in all plants. It is the purpose of the Executive Club to find out how other people "are doing it." The factories and commercial houses directly represented will not be the only ones benefited, for the results of the researches and study will be given to the business world at large through the medium of the leading technical journals.

KNOWING A GOOD EMPLOYEE.

ALMOST everybody at some time becomes an employer of the brain and muscle of other men and women. It may be only a few odd jobs about the house you want done, or it may be a high-salaried private secretaryship you want filled, but whatever the position, you naturally want to find a man or woman who is best fitted for it and who will do that particular work with the greatest efficiency.

How are you going to decide who that person is? Too many employers have tried to solve the problem by "rule of thumb," relying upon some mysterious instinct to show who "would do" or who "would not do." The business world is now beginning to realize, however, that men and women hired in this haphazard way are apt to prove costly experiments.

The selection of just the right men and women for certain kinds of work is fast being reduced to a more or less exact science. Professor Munsterberg, the psychologist, has devised various mechanical tests for determining which of several brains is the most efficient, and physicians are evolving ways of measuring a human being's physical efficiency more accurately than was ever before possible.

Selection Features.

Miss Kathleen Blackford, one of the new employment experts, believes that personal appearance can do much to decide anybody's fitness or unfitness for a certain task. Thus, a light-complexioned person, or a pale blue-eyed individual usually is apt to be more masterful and more capable than a dark-eyed, black-haired, brown-fleshed one. The latter has less mastery that the light one, just as the African races are more contented and docile than the white.

Size, next to color, is a most vital matter as far as indicating efficiency is concerned. Scientific management of the new sort, which reduces labor, time and expense, and economizes every little movement, requires that men and women not over five feet six inches in height should be engaged for work which requires much bending over counters, reaching under shelves, or sitting for a long time in one position.

Workers over this height and up to five feet two inches must never be hired as bookkeepers, bank clerks, or for labor at machines or in positions which make them perform excessive movements. Every ungraceful, awkward bend they make reduces their efficiency and earning power.

Real Ability.

Gait, movement, attitude and posture all play important parts in selecting an employee. A shuffling, shambling walk, dragging and scraping of the feet, means timidity and slavishness. Overbold posing means impudence and effrontery. Real ability and power are evidenced by matter-of-fact, symmetrical and unconscious stride.

Shaking hands as well as the appearance of the hands and the quality of the finger nails all points to the presence or absence of skill. A firm, unconscious handshake with a sound grip which lingers neither too long nor drops the other hand too quickly, is a sign of health, vigor and sincerity.

A flabby shake spells hypocrisy, dishonesty and indifference. It is almost certain proof of inattentiveness and unreliability. Pale finger nails with little picks and tears of the badly-trimmed nail, as well as the presence of long nails, mean nervousness, poor health, slovenliness and the thraldom of bad habits. Any one who bites his nails is one easily muzzled into routine. Wise employers are cautious about hiring nail-biters, as they are apt to get into a hopeless rut.

Long, over-polished, manicured nails usually accompany an extravagant, lazy, over-indulged disposition, while short, clean and smooth nails, which show no evidence of the manicure's work, mean soundness of body and mind and a high degree of intelligence.

Texture and quality of the flesh of the hands and face also shed side lights upon an individual's qualifications for duty. A burrowed brow with sunken flesh around the sockets of the eyes, hollow cheek bones and a flabby skin mean narrowness, bitterness and lack of power to put the full measure of work in an appointed task. If the skin be fine and filmy, and of a smooth spun type, pale and inclined to be dark, the individual is too dreamy and too aesthetic to keep his mind on his task.

Flesh that is taut and smooth, without the earmarks of coddling or the sallowness and pallor of health not exactly at par, is usually a good sign of capacity and endurance. Reddish cheeks and dancing eyes make a man particularly desirable for positions where strangers must be met for the first time.

Miss Blackford has a long list of questions designed to bring to light facts which an inspection of the candidate fails to reveal. Through these skilfully arranged questions those who pretend to frankness and modesty show in their answers that they lack certain accomplishments which are easily discovered. The most dynamic and best endowed workers, it has been found, answer all questions without modesty, without boastfulness and precisely according to the truth.

WHY DO GRINDING WHEELS "FILL" OR "GLAZE?"

By Oscar A. Knight.

I HAVE found with cylindrical grinding that wheels sometimes fill and then glaze. I have also found that wheels sometimes glaze without filling.

Filling of a wheel, commonly called loading, is when small chips adhere to its face. When this condition exists, the clearance places between the cutting particles become filled and prevent the wheel from cutting freely. When a wheel becomes partly filled, and the operator continues to use it in this condition, the few remaining uncovered cutting particles glaze, and he believes the wheel is too hard.

It has been my experience that filling takes place only with soft and tough material, such as brass, bronze and steel, both soft and heat treated. I can recall no difficulty from filling with hardened steel or cast iron.

Causes of "Filling."

Filling may be caused by the wheel running at a speed either very much or a very little too slow. Speed should be from 6,000 to 6,500 surface feet per minute. Filling may also be caused by crowding a hard wheel to a greater depth of cut than the size of the projecting grains, and, revolving at a slow speed with plenty of power, the grains would withstand this crowding without breaking away, and thus "pick-up," as the operators say.

There is one plant where there are eight 6 x 32 in. machines in one department in line with each other. The "Safety First" superintendent obliged the foreman to reduce the wheel speed. The speed of a 14-in. diameter wheel on a 6 x 32 in. Norton machine should be 1,760 r.p.m. The safety superintendent dropped this speed to 1,450 r.p.m. A week later I called, and the foreman asked why he could not finish with the eight machines as he once did. He said he could grind only twenty pieces between truings. With a speed indicator I found his wheel was running about 5,250 periphery feet per minute. We found the old pulleys and brought up the wheel speed. His operator then ground four hundred pieces between truings.

In connection with this subject I will report the action of a wheel which was used in an automobile factory this last month. A 10 in. x 50 in. Norton plain machine was equipped with a 20 in. x 5¼ in. x 12 in., 38, 24 L wheel, grinding vanadium steel shafts 1 in. diameter, and removing .035 in. to limit of .001 in. The shafts were 53 in. long, and their ends were ground 5⅛ in. long. One hundred and eighty-six of these ends were ground in four hours. This time included truing the wheel twice throughout the four hours. One truing lasted for one hundred pieces.

The total wear of wheel on one hundred and eighty-six shafts was .020 in. on diameter, and there being 4¼ in. of wear on each wheel, this means that approximately 40,000 pieces can be ground with one wheel. There was absolutely no filling or glazing. The shafts were inspected by the inspector foreman and pronounced the best work he had seen since he took charge of this department.

Glazing and Its Causes.

Glazed wheels caused by a hard bond of a wheel have become dulled or worn down even with the bond, the bond being so hard as not to have worn away between the cutting particles to give clearance, and thus preventing the cutting particles, when dulled, from breaking away, and allowing new particles to do the work. Glazing is caused by too hard a wheel or too fast a speed or both.

Glazed wheel caused by a hard bond result in spindle boxes wearing out of true and out of line, excessive wear of workshoes, mottles, chatter marks, feed lines, inability to duplicate sizes, loss of production, and a waste of power.

Two-thirds of my visits to instruct operators are to teach them how to use their wheel in order to obtain the greatest production with the least wheel cost, and at the same time produce accurate work. This is rather difficult because the right wheels for certain work in one shop are too soft or too hard to be of use on the same work in another shop.

Piston pins in one automobile factory are finish ground on a 6 in. x 32 in. Norton machine with a 24 O wheel at the rate of 800 per day. In another factory these same pins are ground with a 24 K, 600 per day. Both customers are satisfied with the wheels they are using. The first customer could not use a K wheel, while the second customer could not use an O wheel; and no one can convince the first customer that he should use a K wheel, or any other wheel but a 24 O.

Miscellaneous Features.

What is the difference between glazing and filling?

Filling takes place when wheels are too hard and revolve at too slow a speed, while glazing takes place when wheels are too hard and revolve at too fast a speed.

What are some of the indications that a wheel in use is hard?

If the machine require great power to run it (greater than recommended by its maker), the machine, in all probability, is using too hard a wheel. Other indications are: the necessity for frequent adjustment of wheel spindle boxes; the surface produced may have feed lines, chatter marks, or is of a bluish gray surface when it should be a light gray; automatic cross feed refusing to duplicate sizes quickly, requiring a long time for the cut to disappear after the wheel feed index shows that the work is at the proper diameter; requiring frequent dressing.

If the grinding wheel appear hard, and another wheel cannot be obtained, how can the wheel be better adapted to the work, and why?

If the speed of a hard wheel be too fast, I should first cut it down to its proper surface speed. I should also use a sharper diamond to dress the wheel, because a sharp diamond leaves the surface with more clearance, and the surface would cut like a softer wheel for a greater length of time. I should also increase the surface speed of work, because by increasing the surface speed of work, the grain depth of cut will be increased, and the glazing surface caused by hard bond will wear away, and the surface act like a softer wheel.

If the wheel appear soft, so that it wear away rapidly, what change would you make in the work speed to improve the working of the wheel?

Speed Changes Due to Wheel Wear.

In connection with this subject, I will relate an experience of two years ago. A customer was using a 10 in. x 50 in. Norton machine, grinding work placed on arbors. These pieces were 3¾-in. diameter, by 1⅛-in. face, and ten were ground at one time on the arbors. Using a 3860 L, 18-in. x 2-in. x 5-in. wheel, our machine produced 690 pieces in 9½ hours. As the wheel wore away, the production dropped less and less, until when the wheel was 15-in. diameter, the production was only 600 pieces in 9½ hours. The speed of work, with an 18-in. diameter wheel, was 75 feet per minute. When the wheel wore to 15-in. diameter, with this same 75 feet per minute of work speed, the wheel appeared softer; but in reality it was no softer than it had been at 18-in. diameter.

By decreasing the work speed to 50 feet per minute, and increasing the depth of cut .00050 in., we overcome the difficulty and proved that the wheel was the same grade at 15-in. diameter as it was at 18-in. diameter, and the operator's production the next day, with the same wheel, was 950 pieces.

Thus it is seen that by decreasing the work speed, thus diminishing the grain depth of cut and increasing the radial depth of cut, the production was carried up from 600 pieces to 950 pieces per day without undue wear on the wheel.

All leaks in pipes, flanges and gaskets should be repaired at the earliest possible moment, as they may be caused by defective material.

SYSTEM OF PROMOTION.

IN most plants, particularly those not operated upon a piece-work basis, incentives are necessary to make it worth while for a workman to give his best mind and energy to furthering his employer's interests. One of the very best, most elevating and often neglected forms of encouragement is the assurance of continuous promotion founded upon merit. There is no reason why there cannot be as many promotions as there are benches or machines in the shop. Each position should in any case be accounted a step in advance of some other, and the top situations should have decided advantages. The starting of a new man or apprentice at the bottom need not necessitate a stepping up all along the line. Some are lost, so to speak, on the way up, and enough step-overs can be permitted in cases of marked inefficiency to keep the danger of this indignity ever before the men.

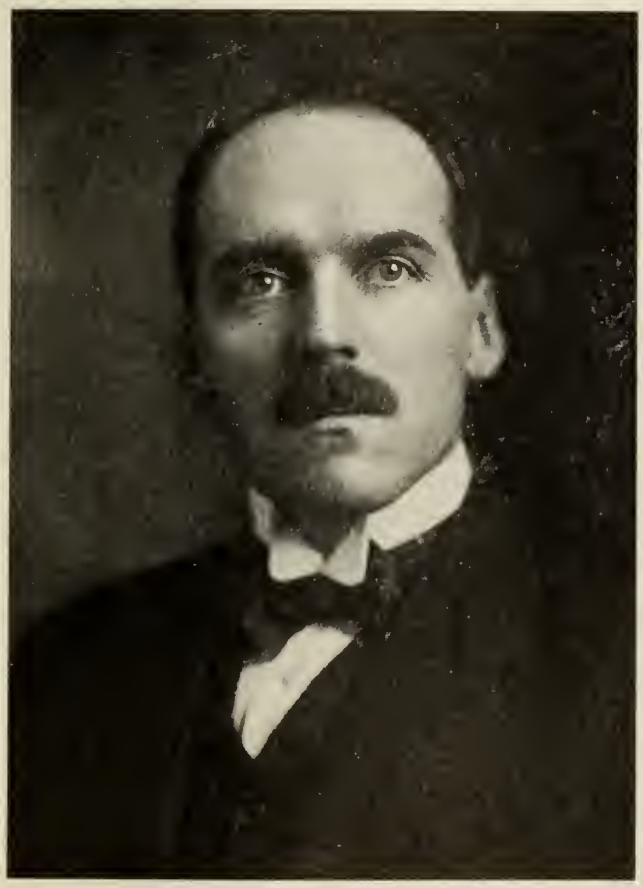
The advantages of such a system honestly and fairly carried out are obvious. An incentive of a high order both for good character and good work is continually in operation; discipline is much more easily maintained; a junior knowing his plan of education can anticipate it and can master it in advance with the help of his immediate seniors in position; the work for which men are best fitted can easily be determined and, above all, a most useful class of mechanics will be produced.

TAXING INDUSTRY.

ONE of the modern excrescences which has gained a foothold on the back of industry is the fad of system. An American magazine which devotes its pages to the gratification of those who take the same delight and satisfaction out of rearranging the management of businesses that a chess player does out of his game makes an appeal for the establishment of a bureau by the Government for the purpose of disseminating knowledge respecting business practice. This is quite in line with the modern tendency to heap on the shoulders of the taxpayer still further burdens. Hitherto the world has progressed as the result of the initiative of the individual—initiative developed by the stress of experience, and the absence of debilitating paternalism. The development of business efficiency and modern methods is the result of hard experience, not of fantastic theorising, nor of government succour. The old school is still adequate. To the establishment of new Government departments agriculturalists of the United States are raising a protest.

Mr. James E. Poole, a well-known cattle man and an authority on cattle markets say that "the tax gatherer and the assessor are working hand in hand and doing night and day stunts with the result that taxation has reached such exorbitant limits that there is likely to be a still greater trek to Canada in the immediate future." Mr. Poole points out that in one county of Indiana, 90 road inspectors have recently been appointed at a per diem of $5, and the farmer pays the toll. Similar protest has been provoked by increase in tax bills in Illinois, Iowa and other states. Due in a large measure to multiplication of officers for political machine building purposes, taxing agriculture to the limit promises to be a questionable policy.

During recent years, the tendency in Canada has been to multiply Government departments which add very largely to the pay roll to be met by taxes upon the workers of the country. By taxing financial corporations legislators are taxing the farmers. The latter think that the burden is not on their shoulders when the tax is specifically placed on premium incomes, bank capital and other revenues of corporations. In this they are absolutely mistaken. All forms of taxation falls upon the back of the actual wealth producer. The lighter the burden of taxation the more buoyant will be the productive energy of the country. There is great need of public economy and the elimination of unnecessary officialism. There are too many men in receipt of public money who know how to do things or make a profession of being in a position to discover better methods than those existing, and too few men who actually do things and make the best of existing machinery and methods.



INDUSTRIAL NOTABILITIES--No. 33

JOHN KENNETH LEVESON ROSS was born at Lindsay, Ont., in 1876, a son of the late James Ross, C.E., Bank of Montreal and C.P.R. director, etc.

He was educated at Bishops' College, Lennoxville, and at McGill University, Montreal, from the latter of which he graduated as a B.A.Sc. in 1897.

J. K. L. Ross acquired his business training under his father through official connection with several of the latter's enterprises, which embraced the City of Birmingham Tramways Co.; the Central London Railway; the Dominion Coal Co., and the West Indian Electric Co.

Rated a millionaire, he is a director, the Dominion Bridge Co.; director, the Lake of the Woods Milling Co.; director, the Canadian General Electric Co.; director, the

JOHN KENNETH LEVESON ROSS.

Laurentide Co.; director, St. John Railway; a governor of the Royal Victoria Hospital, and of McGill University, both of Montreal. He is also an officer of the 5th Royal Highlanders of Canada.

Mr. Ross is a member of the following clubs:—Mount Royal; St. James; Royal St. Lawrence Yacht, Montreal; Royal Thames Yacht (London); Royal Nova Scotia Yacht Squadron (Halifax); Royal Cape Breton Yacht; Royal Montreal Golf; Forest and Stream; Montreal Hunt; Montreal Jockey; Auto and Aero; Montreal Racquet; York (Toronto); Tuna Club of Santa Catalina (honorary).

He married Ethel, daughter of W. D. Matthews, Toronto, in 1902, and resides at 355 Peel Street, Montreal.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., May 4, 1914.—Another week has gone, and conditions show but little, if any, improvement. Navigation opened last week, and this has, of course, resulted in a certain movement of goods westwards, but, generally speaking, trade is now very much quieter than this time a year ago.

In the machinery business there is little to report, a few orders for single machines being all that have materialized during the past week. The Foss & Hill Machinery Co. have found that the present scarcity of money is having a stimulating effect on the sale of second-hand machine tools, many people apparently purchasing these just now with a view to economy. This firm also reports a good trade in concrete mixers and general contractors' supplies, the present fine weather having resulted in a considerable increase of activity in the building trade.

The Canadian Vickers Company have been busy during the past few days carrying out repairs to the Donaldson liner "Saturnia," which went aground last week below Quebec. She was considerably injured, but came up to Montreal in due course under her own steam. By April 30 she had discharged her cargo, and was taken down to Maisonneuve to be dry-docked. A thorough survey of the damage sustained was at once made, and it was found that a number of plates had been cracked. The work of repairing these was commenced at once, and the ship will be undocked again to-morrow morning, after being in dock only 3½ days. This is a very creditable performance, and has excited much favorable comment in local marine circles.

The new mill of the Colonial Wire Manufacturing Co. is now in operation, and is turning out all kinds of steel wire, as well as fence staples, wire nails, wood screws, etc. The plant of the allied concern, Canadian Rolling Mills Co., Ltd., will be completed in about two months from now.

The pig iron situation remains practically unchanged. A few of the larger concerns have placed contracts for second half delivery, but for the most part consumers are chary of committing themselves and prefer to buy in small lots from month to month, according to their immediate needs.

Copper prices remain the same as for the past two or three weeks, the market being still very dull. Tin is a little easier at present, though local dealers have not yet altered their price.

Toronto, Ont., May 5, 1914.—Business men will probably become less pessimistic in their outlook on trade conditions upon receipt of favorable news from the West. Reports state that the seeding conditions are very good, which should have a beneficial effect on trade generally, but to what extent cannot very well at the present time be predicted. An improvement in trade will be welcomed, whatever the cause, for times are dull, and a spirit of caution seems to prevail. Whatever may be the opinion as to the merits of the deal between the Government and the Canadian Northern Railway, details of which have recently been made public, there is no doubt that it will have a beneficial effect on trade, in certain quarters, especially among makers of railway equipment. The Transcontinental road will be finished and put into operation with as little delay as possible. A considerable amount of rolling stock will be required, which will create keen competition among makers of railway equipment.

The much-discussed purchase of the Toronto Street Railway by the City, seems likely to fall through. The capital stock of the railway is to be increased by one million dollars which it is supposed will be spent in improving the service generally and possibly in further extensions to the system. Increased activity along the water front is noticeable, and the shipping season will soon be in full swing. We understand that the lake navigation companies are looking forward to a heavy season in the passenger business. Shippers have been very busy at the principal lake ports in Ontario since the opening of navigation; it is probable, however, that the amount of freight handled this season will be below the average.

A condition of extreme dullness prevails in the steel trade and no improvement is in sight. The advancement of the season and consequent increase in the demand for structural shapes that would naturally be expected, has not, so far, brought improvement. Prices are being maintained, but for how long it is difficult to say. Reports from Pittsburgh state that the steel works are still running at reduced capacity and that a pessimistic spirit prevails. It is highly probable that the Dominion Government will make a further revision in the tariff on structural steel to meet the conditions prevailing in this country. The rolling mills are asking for a duty of $7 per ton which would enable them to raise the necessary capital to extend their plants. The bridge works and allied interests have, however, to be considered and an equitable adjustment made.

No change in the pig iron market is to be noted this week. Consumers are calling for light tonnages, and prices remain at the same level. It is reported that many blast furnaces in the United States are selling below cost and so incidentally losing money.

The machine tool business is quiet and only small orders are being booked. A local concern report having sold a Warner & Swasey lathe and some small tools to a new firm starting in Hamilton. It is hoped that some business will result upon the final adjustment of the C. N. R. deal, already referred to.

Weakness characterizes nearly all departments in the metal market. The volume of business is, however, a little larger than that of the previous week.

Prices remain unchanged and there is still a scarcity of lead.

Ottawa, Ont., May 4, 1914.—The new tariff bill has now passed the Commons and must now run the gauntlet of the Upper House. During the final discussion of the bill, Hon. W. T. White placed before the House some interesting information in regard to prices of American and Canadian mowing machines and harvesters, freight rates and cost of production, all showing that the Canadian manufacturers are at considerable disadvantage in competing in the Canadian North-west.

Before making the changes he did in the tariff, Mr. White made a most thorough examination into the whole question. A representative from the office of the Finance Department examined the question of cost production in the factories of the International Harvester Co. at Chicago and at Hamilton. In addition, a representative from the Customs Department was sent to the Canadian agricultural implement manufacturers as well as to those engaged in business in the United States and to their agents along the border with a view to ascertaining as accurately as possible the difference in the selling price of agricultural implements on either side of the line.

Binder Price Comparisons.

"So far as the East," said Mr. White, "is concerned, there is very little difference in the price of agricultural implements on either side of the line." The difference in the West he showed was only some $10 in favor of the American machine. Mr. Costello of the Customs Department who conducted the inquiry gave the following information as to comparative cash prices on delivery of eight-foot binders:

United States: Fargo, $147.50; Grand Forks, $147.50; Valley City, $150; Devil's Lake, $150; Lansford, $160; Minot, $160; Gardiena, $160; Williston, $165; Havre, Mont., $190; Great Falls, $190; Billings, $190.

Canada: Winnipeg, $160; Brandon, $160; Weyburn, $165; Regina, $165; Calgary, $170; Edmonton, $170.

From a thorough investigation into freight rates it was found that the freight charges upon an eight-foot binder from Chicago to the undernoted places were as follows:—

Minot, N.D., $12.87.
Gardiena, N.D., $12.87.
Williston, N.D., $14.82.
Havre, Mont., $22.81.
Great Falls, Mont., $23.01.
Billings, Mont., $21.84.
Winnipeg, $10.53.
Brandon, $12.09.
Weyburn, $15.79. Regina, $16.18.
Calgary, $22.03. Edmonton, $22.03.

From Hamilton the prices were as follows:—

Winnipeg, $12.80.
Brandon, $14.40.
Weyburn, $17.40.
Regina, $17.80.
Calgary, $24.00.
Edmonton, $24.00.

Mr. White, in discussing the facts he had secured in committee, added: "The committee will bear in mind two things. First, that the Canadian manufacturer is at a disadvantage in respect of freight rates, which are higher from Toronto or Hamilton to the Canadian West than they are from Chicago. Second, the cost of production in Hamilton, as shown by the returns of the International Harvester Company, are considerably higher in that city than they are in Chicago. Bearing these two facts in mind, the committee will have one explanation at least for the fact that the cash price of agricultural implements is somewhat higher in the Canadian West than it is across the line."

Steel Duties Revision.

Through a misunderstanding or misquoting Mr. White, the story got abroad that there would be a further revision of steel duties. This was corrected later by the Finance Minister, who said that when the new duty of $7 per ton on structural steel is put into force, which may be two years from now, owing to the fact that bridge builders and other interests may be affected, it might be necessary to readjust the tariff then. "I may say," added Mr. White, "in order that there may be no doubt whatever about the matter, that it is not the intention of the Government to introduce any further tariff changes at this session of Parliament."

St. John, N.B., May 2, 1914.—Business continues encouraging in St. John and vicinity so far as the industrial world is concerned. Some of the local plants are making alterations or additions to their premises to keep in line with increased requirements, but there has been no word of the establishment of any new industry during the last fortnight or so. The lumber mills have almost all resumed operations after the idle winter months, and this means considerable activity. Extensive repairs have been made on most all of the different plants.

One of the city's most prosperous houses of industry suffered a serious setback this week when the plant of the Christie Woodworking Co., on city road was totally destroyed by fire. The damage is estimated at about $40,000 with about $20,000 insurance. They had many heavy spring orders on hand besides a large stock. The firm will endeavor to carry on their business for the present in their other big factory on Erin street, but it is expected that they will rebuild on the old site. The opinion of some of the firm is that the fire was the work of an incendiary.

The connection of Connolly and Charleson, contractors, of Ottawa, with the extensive harbor developments in St. John has ceased and their interests have been completely taken over by the Maritime Dredging Co. Manning W. Doherty, general manager of the latter concern, confirmed this statement this week, and said the purchase price was between $50,000 and $60,000. The plant includes the tugboat "Falmouth," two steel scows, pile driver, two lighters, cables, and other accessories, and these are now being used by the Maritime Dredging Co., in their reclamation work at West St. John.

Many friends throughout the Maritime Provinces and in different centres of Canada will learn with regret of the death of George H. Waring, president and manager of the Union Foundry & Machine Works, West St. John. He was 65 years of age and had built up a splendid business. He first started in Indiantown, and later was one of the firm of Waring, White & Co., builders of the St. John Iron Works. Mr. Waring was active in civic matters and had for several years been a member of the town council. His death occurred in Killingly, Conn., where he had gone for his health.

The big C.P.R. hotel, the "Algonquin" is to be rebuilt. It was destroyed by fire at St. Andrews a short time ago, but will be replaced by a larger and more modern structure, the contract for its erection having been granted to Robert Clark of Montreal.

It is reported that the sardine factory at Chamcook, N.B., which was built a short time ago at a heavy expenditure, will not be operated this year but will be sold.

Workmen's Compensation.—At last the Workmen's Compensation Act is a reality. To all intents and purposes the Bill is now law. It passed the third reading in the Ontario Legislature a few days ago, and only the assent of the Lieutenant-Governor is necessary to enable the work of appointing the commission and the organization of the Department to proceed. The announcement of the Speaker—" Moved that the Bill do now pass "—provoked loud applause from both Treasury and Opposition benches. The event was particularly gratifying to the Labor representatives present in the galleries of the House, who have been untiring in their endeavors to see the Bill finally through.

BUILT AT A COST OF SOME $335,000,000. THE PANAMA CANAL—A BIRD'S-EYE VIEW.

It is impossible to say at the moment when that great engineering work, the Panama Canal, will be opened for general traffic; for recent indications show that the Culebra Cut continues to be a difficulty. In length, the Panama Canal is some fifty miles from deep water in the Atlantic to deep water in the Pacific. The cost estimated for the completion of the Canal is $335,000,000, a total which includes $20,000,000 for sanitation and $7,500,000 for civil administration, but does not include the $41,250,000 paid to the New French Canal Co. and the $10,000,000 paid to the Republic of Panama for property and franchises. The Gatun spillway, which is a crescent-shaped concrete dam, 808 feet long, holds back the water of Gatun Lake during the dry season and regulates the overflow during the rainy season. The Gatun Lake, formed by impounding the water of the Chagres River, has an area of 164 square miles, and the Canal channel through it is 500 to 1,000 feet wide, and from 39 to 47 feet deep, according to the season of the year.

—Cut, Courtesy Illustrated London News.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Wheatley, Ont.—Marvin White, owner of the electric light plant here, is about to build an extensive addition.

Hamilton, Ont.—The Steel Company of Canada has reopened its blooming and billet mills, and 200 men will be put to work.

Belleville, Ont.—The Walker Foundry suffered by fire on April 30. Many patterns were destroyed, but the fire will not prevent the firm from doing business.

Little Current, Ont.—The property owners last Monday voted in favor of a by-law for a civic electric plant by a vote of 87 to 4. A loan of $12,000 will be raised.

Redcliff, Alta.—Work on the addition to the Ornamental Iron Works plan here is now almost completed. It is the intention of the management to install new machinery which will mean an increase in the staff as soon as this machinery is ready for operation.

New Westminster, B.C.—A new company, composed of Messrs. Stewart, Moore & Wright, of Vancouver, has taken over the D. & H. Brassworks Co., at Sapperton. Two acres of land have also been purchased and a foundry and steel plant will be built.

Belleville, Ont.—The Walker foundry was partly destroyed by fire after 6 o'clock on April 30. The blaze broke out in the pattern shop and storage room on the third floor of the building. It was on this storey that the damage was greatest, many patterns being destroyed. The roof was partly burned, but the fire will not incapacitate the firm. The building, which was of stone, was owned and the plant operated by McCarthy & Wright.

Electrical

Galt, Ont.—In order better to serve the large manufacturing establishments on the west side of the river here, a substation of the Hydro-Electric Commission is being erected.

Renfrew, Ont.—The town will probably install an ornamental lighting system. An estimate has been submitted by the Hydro-Electric Commission which calls for an expenditure of about $8,300. Iron standards and electrical equipment will be required.

Newmarket, Ont.—Three members of the Electric Light and Power Department of the town resigned their positions on May 1. No reasons were given for the resignations, which take effect on May 30. Those who resigned were: Wm. O'Hara, chief engineer; Walter O'Hara, second engineer, and Alf. Bursey, third engineer.

Municipal

New Westminster, B.C. — The city decided to purchase some fire fighting apparatus.

Barrie, Ont.—The town council have recommended that $1,000 be spent in the installation of a fire alarm system.

Point Grey, B.C.—The council have adopted a resolution to investigate a proposal to grant a gas franchise in the municipality.

Toronto, Ont.—The Board of Control reported funds to the amount of $74,504 for the construction of the temporary incinerators.

Montreal, Que.—It is announced that the Board of Control will open negotiations to expropriate the plant of the Montreal Water & Power Co.

Picton, Ont.—A by-law to spend $20,000 on a permanent roadway for Main Street was voted on here last Monday and carried by two hundred majority.

Woodstock, Ont.—The county council have decided to spend $60,000 on improving the roads in the district. A by-law will be voted on to authorize raising a loan.

New Westminster, B.C.—Seagrave & Co.'s tender for two combination hose and chemical trucks for the fire department will probably be accepted. $15,200 is the price quoted.

Bridgeburg, Ont.—The proposed good roads by-law will be voted on by the ratepayers on May 18. The by-law provides for the borrowing of $7,001 on ten year five per cent. debentures.

Tilbury, Ont.— The town council has concluded a deal with Thomas Vickerman for the purchase of the electric light plant for $5,000. Part of the plant will be used for the installation of the hydro system, which it is expected will be in operation here sometime this year.

Calgary, Alta.—The ratepayers on May 1 voted down seven of the ten by-laws submitted. The by-laws which carried were $20,000 for public market extensions, $250,000 for water works extension, and $100,000 for sewer extensions.

Englehart, Ont.—It is likely that the sewerage and water systems will be installed shortly. At the last meeting of the council a by-law authorizing the selling of debentures for the sum of $28,000 was passed. It is expected that the T. & N. O. will give their portion and that the work will soon be started.

Transcona, Man.—The town has submitted to the Provincial Board of Health for approval plans and specifications for a water works and sewage disposal system. A bylaw to raise funds for this work will be submitted shortly, and if carried the work will be begun at the earliest possible moment. It is thought that a sum of $250,000 will cover the expense.

Berlin, Ont.—There is every indication that Berlin will be included in the natural gas belt of Western Ontario in the near future. The Light Commission is negotiating with a company owning the Petrolea gas field, and expects to enter into a contract for a supply to be delivered within the next two months. Natural gas will cut the present gas prices to the consumer in half.

Duncan, B.C.—Work on the new civic lighting plant will probably start in the course of a month. Tenders are being called for the erection of a building of brick construction, suitable for the purpose, on a site previously purchased. The tenders will probably be opened at an early date. When the new plant is in operation it is expected that there will be sufficient current available to furnish all demands.

Sudbury, Ont.—Mayor O'Connor announces that it has been decided to proceed with the construction of pavements at a cost of $100,000 and that a $50,000 sewerage system also would be installed in the near future. He expected that street railway lines would be built by the Sudbury and Copper Cliff Railway Co., while the permanent pavements were being laid. A Toronto firm of consulting engineers has been retained.

Windsor, Ont. — Ratepayers of both Ford and Sandwich, gave majorities to the by-laws on which a vote was taken last Saturday. The by-law by which the Town of Sandwich gave a fixed assessment of $35,000 to the Canadian Alkali Co., for ten years received 217 votes, while only three voted against. The proposal to spend $35,000 for a new town hall in Ford City ended in a closer vote, but the by-law carried by a plurality of 32.

Saskatoon, Sask.—Fourteen money by-laws and six grants were voted on May 1 by ratepayers. Four money by-laws were defeated, being to raise $10,000 for extensions to exhibition buildings, to raise $10,000 for police patrol and fire alarm system, to raise $15,000 for erection of a new power house and to raise $200,000 for extensions to electric light and power plant. Money by-laws for $271,512 were passed, being principally for additions to sewer and water system, extension to pumping plant, and extension to the electric light and power system.

General Industrial

MacLeod, Alta.—Messrs. Staley & Ward, of Edmonton, will probably establish a malting plant here.

Port Dover, Ont.—A new company have taken over the Glencoe Canning Co., with H. B. Chapman as manager.

St. John, N.B.—The Christie Woodworking Co. factory was burned out recently, the loss being estimated at $60,000.

Windsor, Ont.—T. J. Lawson will probably build a structural steel plant on McDougall Street in the No. 1 factory district.

Chatham, Ont.—It is announced that $6,000 will be spent on the fire department. A motor-driven ladder and chemical truck, rubber coats and helmets will be purchased.

Galt, Ont. — Fire destroyed the hair factory of John E. Ward on the Stone road. The loss is $2,000, and is only partly insured.

Beeton, Ont.—That natural gas underlies all this section is evident, for it is present in every flowing well and may be used by those who wish to do so.

Newcastle, N.B.—E. G. Hedman, patentee of a new weigh scale, is endeavoring to promote a company in order to build a factory for making scales.

Teeswater, Ont.—The by-law to loan $4,000 to the Bruce Agricultural Works, to enlarge their plant, has passed. The vote was 113 for and 28 against.

Medicine Hat, Alta.—A. C. Tegge, general superintendent of the Canada Cement Co., states that the company is going ahead with the completion of their plant at Dauntless, Alta.

Berlin, Ont.—A small fire occurred in the newly completed building of the Quality Mattress Co., of Waterloo. The cause of the fire was from some flying molten metal lodging in cotton bales.

Lethbridge, Alta.— The Lethbridge Face Brick and Clay Products Co., will establish a plant here for making pressed tapestry and hollow brick. Mr. James A. Close, late of Woodstock, Ont., is interested.

Toronto, Ont.—Fire of an unknown origin was responsible for damage to the extent of $165 to the building and contents of the Peerless Silver Plating Co. at Queen Street and Henderson Avenue on April 29.

Lethbridge, Alta.—James A. Close, of Woodstock, Ont., has established an industry here for the manufacture of dry pressed and hollow brick and drain tiles. Sixteen acres have been purchased from the C.P.R. for the plant.

Estevan, Sask. — Negotiations have been completed and contracts signed between the town and the Brick and Coal Co. for a supply of power at 3 cents per kilowatt. The company's plant will cost about $100,000. Construction commenced May 1.

Medicine Hat, Alta.—The Industrial Loan and Guarantee Co., Ltd., has been formed for the purpose of assisting responsible industrial concerns who need capital to locate here. The company is capitalized at $1,000,000. E. L. Chudleigh and H. H. Brown are interested.

Walkerton, Ont.—After several years of idlenesss, it is announced that the old Binder Twine Co.'s factory here is to be reopened and will be in operation in July. Manager Connors, an official of the chain of similar factories in the province, stated that cord would be manufactured.

Windsor, Ont.—The Dowsley Spring and Axle Co. had fully decided to build a factory this spring on a site the company purchased in No. 2 district on Howard Avenue, but owing to a serious fire the plans were deferred. The industrial committee granted the company's request for a year's extension of time.

Lindsay, Ont.—B. Cooper, of Toronto, president of the Cooper Cap Co., and C. D. Wilder of the same firm, were here recently, with a view to establishing a branch factory. Mr. Cooper stated that they wished to establish another factory to take care of their Eastern Canada trade, owing to the congestion in their warehouse at Toronto.

Waterloo, Ont.—The ratepayers of this town have decided to loan the Globe Furniture Co. the sum of $50,000 for twenty years and to grant it exemption from taxation for ten years, on condition that a large addition, costing $125,000, is erected at the present plant. The vote was 510 to 175 in favor of the by-law, a majority of 53 over the necessary two-thirds of the vote polled.

Melfort, Sask.—The Canada-West Grain Co., of which Mr. H. C. Dawson is president, and the head office here, will open a branch in Winnipeg, with Mr. Leslie, formerly manager of the Saskatoon Milling Co., in charge. Several new elevators will be built in this district this summer, and arrangements are under way for the purchase of others. Work will start shortly on the new elevator at St. Brieux.

Woodstock, Ont.—At a special session of the county council an order in Council was read authorizing an expenditure of $320,000 on a system of county roads for Oxford, with the proviso that only $60,000 shall be spent in one year. A by-law was introduced providing for the raising of the latter amount among the various municipalities. General satisfaction was expressed at the Government's good roads policy.

St. John, N.B.—Authority has been granted by the Legislature to the Bathurst Lumber Co. to build a dam on the Nepisiguit River, where it is proposed to put up a pulp and paper plant estimated to cost $3,000,000. The agreement with the Provincial Legislature, however, stipulates that the company is to pay the Government two dollars per horse power per year for any power sold and not used in the paper plant.

Galt, Ont.—The by-law to loan $12,000 to the Maple Leaf Bedding Co., Ltd., will be voted on by the ratepayers on Thursday, May 28. The town council has another industrial proposition before it now. The Galt Machine Screw Co. wants to build a large plant and has asked the town for a loan of $15,000. Whether this by-law will be voted on at the same time as the other has not been decided, but definite action will be taken at the next meeting of the council.

Building Notes

Saskatoon, Sask. — The Speers & Mighton Co., will build a warehouse here to cost about $27,000.

Edmonton, Alta.—Brown & Hargreaves have been awarded a contract for the

Auld, Howsin & Bell building at $50,000.

Peterborough, Ont.—Barries, Ltd., will erect a four-storey steel and concrete building, at an estimated cost of $45,000.

Welland, Ont. — An armory, costing $50,000, will be built here. A site has been donated by the Plymouth Cordage Company.

Edmonton, Alta.—Williamson Bros., have awarded a contract to Nesbitt & Miller, contractors, for a four-storey building to cost about $100,000.

Calgary, Alta.—Thirteen tenders were received by the city council for the construction of the new industries building at Calgary, the lowest tender received being that of P. Lyall & Sons at $188,600, for the building, complete.

Trade Gossip

W. W. Chadwick, B.A. Sc., Toronto University, is establishing a factory at Hamilton, Ont., for making electric fixtures.

The Calhoun and Knechinmeister Co. of 60 Third Street, Carlstadt, N.J., would like to have catalogues of all descriptions for their file.

The Olympia Hotel, Winnipeg, Man., is being equipped with a 20-ton Arctic refrigerating plant, which was supplied by the Arctic Ice Machine Co., Canton, Ohio.

The Consumers' Ice Co., Winnipeg, Man., have purchased 11,500 feet of piping for their 3,500 ton ice storage house, from the Arctic Ice Machine Co., Canton, Ohio.

The Great Lakes Dredging Co., Ltd., and several other companies controlled by Mr. James Whalen, have occuped offices in the new Whalen Block, Port Arthur, Ont.

The Dominion Steam Heating Co., Toronto, have submitted an application to the Board of Control for permission to install a central heating system for office buildings, etc.

The Crystal Ice Co., Calgary, Alta., are installing a complete 50-ton Arctic Pownall raw water ice-making system, to be equipped with Arctic-Pownall shell brine coolers and operated by a gas engine.

Duff & Gatfield's marine reporting and vessel agent offices in Sandwich and on Livingstone channel, have been opened for the season. Jack Gatfield and Grant Duff will be at the Sandwich office, and Percy Thrasher and M. Kelly at Livingstone channel.

The Chicoutimi Pulp Co. has purchased from the Atlantic, Quebec and Western Railway 400,000 acres of freehold pulpwood land, which was given to the railway for the construction of 100 miles of railway line extending from New Carlisle to the Gaspe Basin.

The Buffalo Foundry and Machine Co. of Buffalo, N.Y., announces that they have terminated the arrangement whereby Mr. H. E. Jacoby has been representing them in New York city and vicinity. They are now handling direct all vacuum apparatus, castings, patterns, and machine work.

The Donaldson liner Saturnia, which struck a rock in the St. Lawrence on her trip from Glasgow, has been put into the Duke of Connaught drydock for repairs, as several of her plates are badly torn. The Saturnia was to have sailed for Glasgow last Saturday, but will be delayed for several days.

The Canada Coke Corporation,; Universal Tool Steel Co., Ltd.; Electric Furnace Products Co., Ltd.; Dominion Engineering and Machinery Co., Ltd.; Galbraith & Cate, Ltd.; and the Corbett Contracting Co., Ltd., have recently been incorporated in Toronto. These companies had already obtained Federal charters.

Loco Works at Fort William.—Reports are current to the effect that C. P. McLennan, of Halifax, is in London, England, promoting an English company for the manufacture of railway locomotives at Fort William. The capital of this Anglo-Canadian Locomotive Co., it is stated, will be $1,000,000, of which $400,000 will shortly be issued in England.

The Alberta, Athabasca and Manitoba, of the C.P.R. lake lines, have been overhauled during the winter and fitted with new boilers and equipment, which will reduce the time of their passage between Port McNicoll and Fort William by three hours, so that they will make the same time on the route as the newer Keewatin and Assiniboia. The whole of the electrical wiring on these vessels has been renewed, and at the same time electric reading lights have been installed in each berth.

Ottawa, Ont.—A report to Bradstreets states that building operations at the Chaudiere will likely employ as much labor this year as last, for although the Eddy Company's new power house and pulp mills are completed, extensive building is being done by the Ottawa and Hull Power Manufacturing Co. and also by J. R. Booth. With the development of more power and the installation of additional machinery at the Hull works, the daily output of the Eddy plant will be increased; there should, therefore, be no falling off in the employment of laborers nor any decrease in the amount paid in wages. The saw mills are ready to start early next month, while Eddy's mills are already running full time and employing full staffs.

The Town of Sarnia, Ont., has recently placed an order with the Herbert Morris Crane & Hoist Co., Ltd., for one of their standard type G hand operated overhead traveling cranes. This crane will have a capacity of 10 tons, and a span of 49 ft., 3 in., and is to be used in the new power house at Point Edward. We understand that the placing of the order was influenced by the satisfactory service given by another Morris Crane in Sarnia at the plant of the Sarnia Gas & Electric Light Co., Ltd.

Technical Education Shelved.—The Government evidently does not intend to do anything, this session at least, towards carrying into effect the recommendations of the report of the Royal Commission on Technical Education. There has been no hint of any action so far. A reply given to a question of Mr. E. M. McDonald in the Commons a few days ago by Premier Borden was decidedly evasive. Mr. McDonald asked whether any steps would be taken this session to assist in the extension of the advantages of technical education in Canada along the lines of the Commission's report. Premier Borden said:—"The whole subject has been under careful consideration and has been taken up with the Governments of the different provinces. The House will be duly informed of any legislative action which may be contemplated." As a matter of fact, practically nothing is being done at all at present in the matter by the Government.

Railways—Bridges

Dixie, Ont.—Efforts will be made to get the municipalities embraced in the Etobicoke, Toronto and Milton townships interested in Hydro radials. Representatives from these townships will shortly wait on the Hydro-electric Commission.

Truro, N.S.—The Intercolonial Railway Co., is installing a new water service at its station at Matapedia, at an estimated cost of $16,000. It is expected that the work will be completed within a few days. The contractor is K. A. Morrison of Ottawa.

Ottawa, Ont.—A scheme for an electric railway from Toronto to London and Windsor, with branches to Woodstock and Stratford, has fallen through

with the withdrawal in the Railway Committee on April 30, of the Western Central Railway Bill asking a time extension.

Transcona, Man.—The town council have granted a franchise to John Henry Kern, of Moose Jaw., to build and operate an electric railway between here and Winnipeg. An agreement has been signed and it is announced that the railway will be in operation by the end of October of this year.

Marine

Point Grey, B.C.—As a result of the inundation of Sea Island last spring during the extreme high tides and the resultant agitation for a proper dyke around the Island, it has been suggested that a dyke be built at a cost of $36,000. Cleveland & Cameron of Vancouver, are the engineers.

Contracts Awarded

Toronto, Ont.—The Harbor Commissioners have awarded the contract for dredging the channel approaching the Toronto docks to Mr. John E. Russell. The tender accepted called for 13 cents per cubic yard, or a total amount of $4,500.

Victoria, B.C.—E. G. Prior & Co., of this city, have been awarded the contract for all the steel work for the two new Government piers at the outer wharf. The contract was let by Grant, Smith & McDonnell, the general contractors, to the local firm. The tonnage amounts to between 6,000 and 7,000 tons and the amount involved is in the neighborhood of $250.000. Deliveries will commence in two weeks.

Humboldt, Sask.—The following contracts have been awarded:—(B), Pump house station, Hanson & Paul, $5,120, and foundations for machinery at $8 per cubic yard; (C), Water tower, G. A. Sisson, $12.000; (D), Water pipes and specials, Canadian Allis-Chalmers Co., Ltd., $40.50 per ton for cast iron pipe, $69.25 per ton for special castings; (E), Hydrants and valves, Canadian Allis-Chalmers Co., Ltd.. hydrants $46.20 each, steamer nozzles 75c per inch, sprinkling cranes $56.20 each, gate valves 10-inch $35.30 each; 8-inch, $22.30 each; 6-inch, $14.75 each, valve boxes, $14 each; (N), 12-inch wooden pipe, Pacific Coast Wood Pipe Co., 45c per foot, F.O.B. Humboldt; (P), Sewage pumping station, Flanagan & Murphy, $7,900; (X) Sewage disposal works, Flanagan & Murphy, $16,855, pipe laying $2 per foot. The contract for the pumping machinery was not awarded, but the tenders received averaged about $13,000.

Tenders

Duncan, B.C.—Tenders will be called shortly for the construction of a brick power house.

Winnipeg, Man.—Tenders will be received up till May 22 for the delivery of induction feeder regulators. Specifications may be obtained from the Light and Power Department, 54 King Street, Winnipeg, Man.

Toronto, Ont.—Tenders will be received up till May 19 for one or more 24,000,000-gallon centrifugal pumps and engines. Plans and specifications may be obtained from Purchasing and Accounting Section, Department of Works, City Hall.

Winnipeg, Man.—Tenders will be received up till May 23 for boilers and stokers required in the new powerhouse, Winnipeg. Plans and specifications may be obtained from the Provincial Architect, 261 Front Street, Winnipeg, Man.

Toronto, Ont.—Tenders will be received up to May 12, 1914, for the complete supply and installation of electric passenger elevator on east side of City Hall, Toronto. Copy of specifications may be obtained at the offices of the Property Department, City Hall.

Montreal, Que.—Tenders will be received up till May 19 for supplying, building, and erecting at the low level pumping station two 12,000.000-gallon steam-driven, high-lift centrifugal pumping engines. Specifications may be obtained from the Superintendent of Waterworks, City Hall.

Toronto, Ont.—Tenders will be received up to Monday, May 18, 1914, for the construction of dams, head-works, etc., and for the excavation of a canal in connection with a power development at Eugenia Falls. Plans and specifications may be obtained at the offices of the Commission, W. W. Pope, secretary, Hydro-Electric Power Commission, Continental Life Building, Toronto.

Carleton Place, Ont.—Tenders will be received until May 18, 1914, for the following works:—(2) Furnishing materials for and constructing a pump house and intake pipe; (3) furnishing materials for and constructing a sewage disposal works. Plans, specifications and forms of tender may be seen at the offices of Aird Murray & Lowes, consulting engineers, Toronto, or at the office of the Town Engineer, Carleton Place.

New Incorporations

Automatic Chemical Sprinkler Co., Ltd., of Toronto, has been incorporated with $100,000 capital.

The Principello Steamships, Ltd., has been incorporated at Toronto with a capital of $150,000 to acquire and operate steamships at Toronto. Incorporators:—G. Ruel, S. C. Snively, A. J. Reid, of Toronto.

The Multipress Co., Ltd., has been incorporated at Toronto, with a capital of $6,000, to manufacture typewriters, etc., at Toronto. Incorporators—S. D. Biggar, F. F. Treleaven, R. W. Treleaven, all of Hamilton.

The Toronto & Hamilton Electric Co. has been incorporated at Toronto, with a capital of $200,000, to carry on business as electricians, etc., at Hamilton. Incorporators—R. Lynch, H. E. Job, R. Crompton, all of Hamilton.

The Canadian Fleischer Gas Co., Ltd., has been incorporated at Toronto, with a capital of $40,000, to manufacture gases for industrial purposes at Toronto. Incorporators—R. R. Bruce, J. Leith, L. Archibald, all of Hamilton.

The Demees Electro-Plating & Mfg. Co. has been incorporated at Toronto, with a capital of $40,000, to manufacture plated goods, etc., at Toronto. Incorporators—F. Demees, W. Casper and P. Mehlhorn, all of Toronto.

A. Barnet & Co., Ltd., has been incorporated at Ottawa with a capital of $250,000 to carry on the business of sawmill proprietors at Renfrew, Ont. Incorporators:—A. Barnet, J. E. H. Barnet, T. F. Barnet, of Renfrew.

The Benjamin Wheel Co., Ltd., has been incorporated at Toronto, Ont., with a capital of $150,000, to manufacture wagons, etc., at Yarker, Ont. Incorporators—R. H. Parmenter, A. J. Thompson, and W. S. Morlock, all of Toronto.

The Federal Co., Ltd., has been incorporated at Ottawa with a capital of $100,000 to manufacture and deal in paper, pulp, pulp wood, etc., at Montreal. Incorporators:—J. J. Meagher, H. N. Chauvin, P. W. Peacock, of Montreal.

The Canadian Laco-Philips Co., Ltd., has been incorporated at Ottawa with a capital of $25,000 to manufacture all kinds of electrical, steam, and hydraulic machinery at Montreal. Incorporators:—J. S. Lovell, W. Bain, R. Gowans, of Toronto.

The Downing-Cook Co., Ltd., has been incorporated at Toronto with a capital of $50,000, to carry on the business of

general contractors, engineers, etc., at Montreal. Incorporators:—W. R. L. Shanks, D. P. Gillmor, F. G. Bush, of Montreal.

The Lancaster Water Works, Ltd., has been incorporated at Ottawa with a capital stock of $20,000 to construct and operate equipment for the generation of electricity at Lancaster, Ont. Incorporators:—A. Powell, T. Aubry, D. P. J. Tobin, all of Lancaster.

The Polson Dry Dock and Shipbuilding Co., Ltd., has been incorporated, with a capital stock of $2,000,000 and head office in Toronto. The company is empowered to do a general shipbuilding business, dredging, the construction of public and private works, etc.

The Canadian Wood Distilling Co., of Cranbrook, Alta., with a capital of $100,000 has been incorporated and proposes to carry on the business of wood distillers and timber preservers, paint varnish and pigment manufacturers and chemical engineers and to establish factories for any of the above purposes.

Catalogues

Electric Household Helps deals with electricity and its application in the home for various purposes, such as cooking, ironing, etc. This booklet, which is fully illustrated, is being distributed by the Canadian Westinghouse Co., Ltd., Hamilton, Ont.

Westinghouse Railway Lighting Protection is the name of a booklet published by the Canadian Westinghouse Co., Ltd., Hamilton, Ont., to explain their system for protecting cars on electric railways from lightning. The different types of "Westinghouse" lightning arresters are described fully, accompanied by illustrations of the apparatus.

Oil Purifiers.—"How to Purify Transformer and Switch Oils Economically" is the title of bulletin No. 87, recently published by the Elliott Co., Pittsburgh, Pa. The "Elliott" capillary filter, designed for the above purpose, is described in detail, accompanied by a sectional view showing the construction. Copies may be obtained by writing the company.

The Morris Overhead Runway, type Q.E.F., is graphically described in bulletin B 4, just issued by the Herbert Morris Crane and Hoist Co., Ltd., Toronto. Views are shown of some interesting installations, one in particular showing the ease with which a heavy boiler can be handled with the help of a runway as compared with manual labor. Copies of this bulletin may be had by writing.

Turret Lathe.—The Steinle Turret Machine Co., Madison, Wis., are distributing a leaflet dealing with their full swing side carriage turret lathe. A full description is given of the lathe, including a list of the principal dimensions. The illustration shows in a clear manner the general design of the lathe. Copies of this leaflet may be obtained from Manning, Maxwell and Moore, New York.

The Lighting of Woodworking Plants by Modern Methods is the title of bulletin No. 43400, recently issued by the Canadian General Electric Co., Toronto. The bulletin deals with the application of "Mazda" lamps in woodworking plants and emphasizes the value of efficient illumination from a "safety first" standpoint. The plates show several installations of "Mazda" lamps in woodworking shops. Tables are included, giving particulars of these lamps.

The Lighting of Machine Shops and Metal Working Plants is dealt with, in an interesting manner, in bulletin No. 43402, being distributed by the Canadian General Electric Co., Ltd., Toronto. The subject is treated in a general way, introducing the "Mazda" lamp and setting forth its claims. The bulletin contains a number of plates showing the illumination features of various shops lighted with "Mazda" lamps. Tables are included giving data for the latter.

Watthour Meters.—The Canadian Westinghouse Co., Ltd., Hamilton, Ont., have sent us a bulletin, No. 1137, descriptive of their Watthour meters for alternating and direct current. The principles of construction and operation are dealt with fully, while considerable space is devoted to a description of the type C meter. A feature of the bulletin is the arrangement of the illustrations, several of which show very distinctly the constructional details of the meters, the name of each part being indicated by means of arrows.

Aberthaw Tests on Concrete in Sea water is the title of a 36 page booklet issued by the Aberthaw Construction Co., Boston, Mass. The booklet consists of a report of an investigation made by the company and H. L. Sherman at the United States Navy Yard, Charlestown, Mass., to determine the effect, both mechanical and chemical, of the action of sea water and varying temperatures upon concrete piers of varying composition. The particulars and results of each test are given, accompanied by an illustration of each sample, reproduced from photographs which show the physical condition of the concrete after being tested.

THE MODERN BUSINESS MAN.

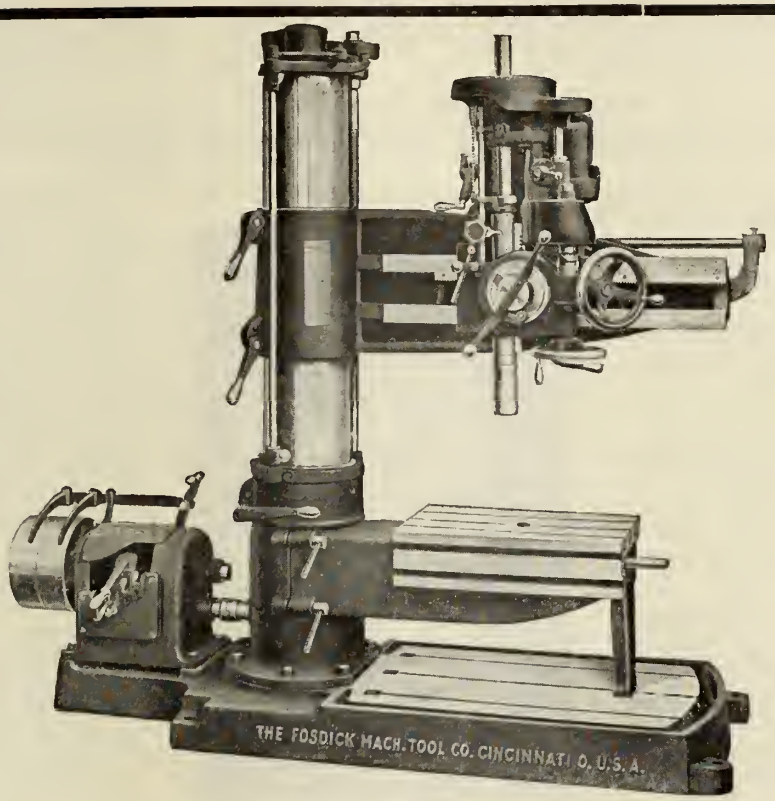
DEAN INGE, of St. Paul's, London, England, whose lectures on things modern have won for him the sobriquet of "the gloomy dean," declares that Protestant asceticism is responsible for that singular product of our civilization known as the modern business man. He said recently:

"When one reflects that a man is constitutionally indolent, that his natural desires are easily satisfied, and that unremitting attention to money making disqualifies its votary from enjoying the finer pleasures of life, it must be clear," he said, "that nothing but a queer sort of religious self-mortification could induce many persons to choose the life which the successful business man has to lead.

"When the money maker was an honest merchant, subduing the earth and really creating wealth to the public advantage, his work might be an instrument of valuable moral discipline; but now that the financier had dethroned the merchant; now that wealth was appropriated rather than created, the connection between religious austerity and business was almost dissolved, and there was the unedifying spectacle, so common in America, of the unscrupulous speculator, who made his home in his office, while his wife squandered his illgotten millions in vulgar and senseless extravagance."

SOO STEEL PLANT MAKES NEW RECORD.

NEW high records in the production of pig iron, rails and coke were made by the Algoma Steel Corporation in March. The production of pig iron was 30,420 tons, as compared with the previous record of 29,800 tons in April, 1913; of rails, 29,640 tons, as compared with the previous record of 29,200 tons last July, and of coke 40,760, as compared with the previous record of 37,600 tons in January, 1913. This month the corporation received an order for 10,000 tons from the Grand Trunk Railway, at 50 cents per ton over the price paid by competitors. The corporation is now the one Canadian steel plant running full at the moment, and is likely to run full for some time to come. With orders in sight, the corporation's output bids fair to be covered until September.



New Westminster, B.C.—The contract for dredging the north arm of the Fraser River has been given to the Pacific Dredging Co., of Port Coquitlam. The value of the contract is over $800,000, and the work will be completed in two years.

$58 OPENS THE WAY FOR FULL AUTOMATIC MACHINERY

Our Open Back Power Bench Press No. 201 has been reduced to the very elementals of flexibility in equipment. Either Single or Double-Action Presses can be supplied.

The Plain Press can be purchased—as illustrated, to be fastened to a bench. Or a complete Press with Iron Table and Legs can be ordered. The Table can be ordered with the Press or it can be ordered at any time in the future. Both Press and Table are standardized.

A Back Roll Feed can be ordered with the Press or it can be ordered whenever requirements make it necessary. This Feed takes the metal from a reel and automatically draws it under the tool ready to be operated upon. It feeds in either direction, front to back or back to front, and by adjustment moves the metal forward any predetermined distance at each operation. There is no chance of accident when this attachment is applied as it takes away the necessity of hand operation and makes the Press a Full Automatic Labor Saving Machine.

A Side Roll Feed can be ordered with the Press or at any future time. This takes the metal from a reel in a similar manner to Back Roll Feed, but being attached to side of Press feeds the metal across the bed from right to left or left to right as may be desired. It allows of greater operating space for tools as the metal travels across the greatest width of bed and punch block. Rolls can be adjusted in relation to bed of press.

A Transfer and Automatic Stop Attachment can be ordered with Press or at some later date. This is used in connection with Back Roll Feed. After Press has reached the limit of operation under regular equipment the Transfer carriers or transfers the blank into position for one more operation. It allows one additional operation without rehandling to what would be possible without such attachment.

A Dial Attachment may be ordered with the Press or at any future time. A Dial Attachment will handle small partly finished objects with speed where it would be both dangerous and slow to feed directly to the tool by hand. Lift Pin for Dial and other variations of attachments making them suitable for particular purposes can be fitted.

Bulletin No. 201 gives Full Details and can be had for the asking.

TAKE NOTICE

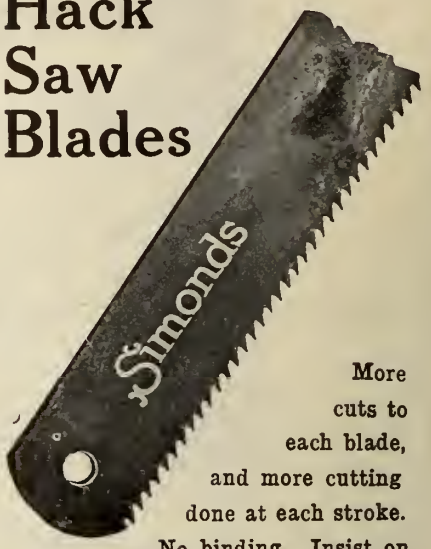
That the Stanyon Metallic Furniture Co., Limited, now The Anchor Manufacturing Co., Limited, of the City of Toronto, duly manufactured the movable grate covered by Canadian Patent No. 101,997, and that the Bennett & Wright Co., Limited, of the same city, duly manufactured the hot water heater covered by Canadian Patent No. 107,120, prior to the period called for by the Patent Act, and the said firms are prepared to fill any further orders for the two above inventions at a reasonable price. Ridout and Maybee, 59 Yonge St., Toronto, solicitors for Anders B. Reck.

L. J. Street of Montreal, assistant sales manager for the Dominion Iron & Steel Co., of Sydney, is visiting Vancouver, B.C.

J. A. Jamieson, who is building the Government elevator at Port Colborne, Ont., has returned to Montreal, and reports that about seventy-five per cent. of the work is completed.

Fred Dane, who recently retired from the Temiskaming and Ontario Railway Commission, has accepted the position of general agent in Glasgow, Scotland, for the Dominion Government.

P. V. Mitchell has been appointed manager of the passenger department for the White Star Dominion Line, with headquarters in Montreal. Mr. Mitchell was previously in charge of the first-class cabin department.



Cecil Doutre, purchasing agent of the Department of Marine and Fisheries, is severing his connection with the service and will go to Montreal as commercial manager of the Canadian Vickers Co., an important post. Mr. Doutre has been in the service for a number of years, and is a valued official.

W. G. Ross, F. W. Currie and M. P. Fennell, chairman, chief engineer and assistant secretary Montreal Harbor Commission, respectively, are expected to return to Montreal early this month from England. They are now preparing their report on the tour and this document is to be ready on their return.

BookR eviews

The Department of Trade and Commerce of the Dominion Government has published part 4 of the report of the fiscal year ending March 31, 1913. This section of the report is devoted to miscellaneous information covering the trade returns of the Dominion for the period stated above.

Every ball takes its share of the load in

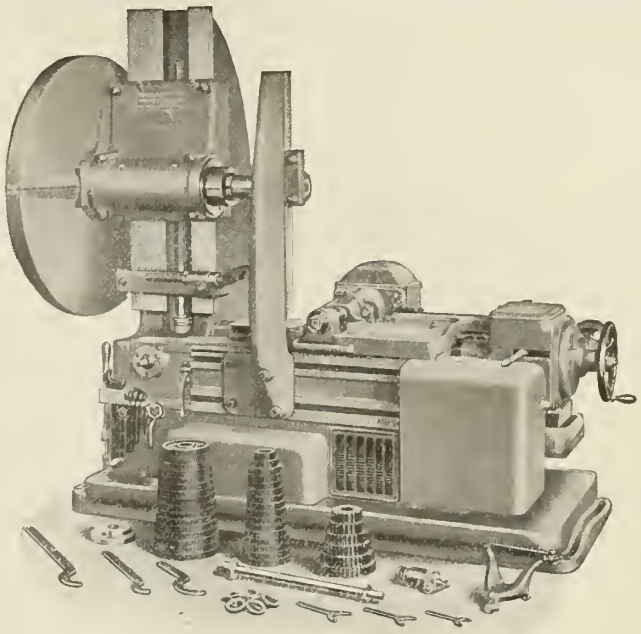
Hoffmann

Journal and Thrust Bearings

The Reason

Every Hoffmann Ball is guaranteed not to vary from absolute spherity or standard size by one ten-thousandth of an inch (about one-tenth the thickness of tissue paper.)

The Result



Because the load in Hoffmann Bearings is thus equally distributed, friction is reduced to a minimum, and the life of both Balls and Races is greatly prolonged.

We have over 40 sizes of Hoffmann Balls in stock, from 1-16 to 4 inches, and over 50 sizes of Journal and Thrust Bearings.

For Rapid Cutting Of Heavy Spur Gears.

Rapid production depends on a rapid, powerful drive, rigid design, and convenient arrangement of parts,—requirements fulfilled by the No. 6 Automatic Gear-Cutting Machine shown above.

The constant speed driving pulley is of large diameter and wide face. With a large overhead pulley the belt has large contact and powerful leverage.

Ample power is delivered to cutter spindle through a worm drive which insures rapid, yet smooth cutting action. "Idle" movements of returning cutter slide and indexing are performed at a fast constant speed independent of cutter speed or feed. Indexing mechanism has accelerating and retarding action so it can operate rapidly without shock.

The machine is rigid, cutter-slide has large bearing surface, cutter and work spindles are of large proportions. These features permit fast speeds and feeds without impairing accuracy.

Special circular free on request.

Canada is often called the LITTLE GIANT among nations, because its producing and purchasing power per capita is greatest.

Canadian Taps and Dies are trade-marked

Little Giant

because their capacity and accuracy in the production of threaded work is highest.

There's always a reason.

Have You a

Little Giant.

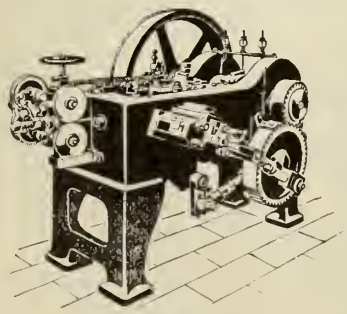
In Your Shop?

Try the tap with specially finished thread walls and note its smooth-working qualities.

Try the Die that is as strong as a solid die, yet can be instantly adjusted and resharpened indefinitely.

Made In GALT, Ontario

CANADIAN TAP AND DIE COMPANY



FOR YOUR SHOP

DENNISTEEL
SHELVING and BINS

Our steel shelving occupies 30% less space than wood. It's easily erected and can readily be changed to bins and back again to shelving. Built on the unit system, more sections can be added any time. It's fire-proof, sanitary and vermin-proof. If you move you can take it down without breakage, and it costs no more, generally less, than wood. It's interesting. We will gladly tell you more about it.

Dennis Wire & Iron Works Co., Ltd.
London - Canada

AUTOMATIC MACHINES
FOR MAKING

Double Stroke Bolt and Rivet Press

Barb Wire—Bolts—Buckles—Coach Screws—Cotter Pins—Cut Nails and Tacks—Electric Welded Chains—Furniture Springs—Hinges—Hooks—Locks—Nails—Rings—Rivets—Screws—Shoe and Sole Nails—Staples—Wire Nails—Wire Tacks—Wood Screws.

AND ANY OTHER ARTICLE MADE FROM WIRE.

Wire Straightening and Cutting Machines—Screw Thread Rolling Machines—Screw Head Slotting Machines—New High-Speed Wire Nail Presses, etc., etc.

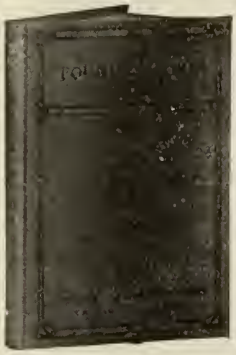
Mechanical Engineering Books



If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.

MACHINE-SHOP WORK. By Frederick W. Turner, Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price ...$1.50

MECHANICAL DRAWING. By Ervin Kenison, S.B., Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price $1.00

FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 142 illus. Cloth binding. A practical guide to modern methods of moulding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price $1.00

PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price $1.00

MACHINE DESIGN. By Charles L. Griffin, S.B., Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price $1.50

FORGING. By John Lord Bacon, Eng. and Supt. of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price $1.00

TOOL MAKING. By Edward R. Markham, Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers, Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels—annealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandreis, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price $1.50

Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers, Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.

Don't Be a Commercial Explorer

¶ You haven't time to go exploring round on your own account discovering who's who in machinery and supplies.

¶ Time is too valuable these days.

¶ If you want to buy a machine or piece of equipment the easiest way is to consult this Directory.

¶ *The firms represented here are modern, reliable,* and their prices are right, and *they are already on the map.*

Use this modern guide to good buying.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

Air Compressors.
A. R. Williams Machy. Co., Toronto.
Berkshire Mfg. Co., Cleveland, O.
Bury Compressor Co., Erie, Pa.
Cleveland Pneumatic Tool Co. of Canada, Toronto.
Canadian Ingersoll-Rand Co., Ltd., Montreal.
Can. Niagara Device Co., Bridgeburg, Ont.
Curtis Pneumatic Machinery Co., St. Louis, Mo.
Martin & Co., W. A., Toronto.
Stuart Machinery Co., Winnipeg.
E. J. Woodison Co., Toronto.

Alloys.
Hermann Boker & Co., Montreal.
Dominion Fdry. Sup. Co., Montreal.
Martin & Co., W. A., Toronto.
Frederic B. Stevens, Detroit.
E. J. Woodison Co., Toronto.

Anodes, Brass, Copper, Nickel, Zinc.
W. W. Wells, Toronto.

Ammeters.
Bennett-O'Connell Co., Chicago.
E. J. Woodison Co., Toronto.

Autogenous Welding.
W. D. Beath & Son, Toronto.

Barrels, Tumbling.
Abbott Ball Co., Hartford, Conn.
Can. Hanson & Van Winkle Co., Toronto.
Columbian Facing Mills Co., Buffalo.
Dominion Fdry. Sup. Co., Montreal.
Federal Fdry. Supply Co., Cleveland.
Frederic B. Stevens, Detroit.
Hamilton Facing Mill Co.. Ltd. Hamilton, Ont.
J. S. McCormick Co., Pittsburg, Pa.
Northern Crane Works, Ltd., Walkerville, Ont.
E. J. Woodison Co., Toronto.
Whiting Foundry Equipment Co., Harvey, Ill.

Boiler Graphite.
Joseph Dixon Crucible Co., Jersey City, N. J.

Blowers.
A. R. Williams Machy. Co., Toronto.
Can. Buffalo Forge Co., Montreal.
Can. Hanson & Van Winkle Co., Toronto.
Canadian Ingersoll-Rand Co., Ltd., Montreal.
Columbian Facing Mills Co., Buffalo,
Dominion Fdry. Sup. Co., Montreal.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
J. S. McCormick Co., Pittsburg, Pa.
Monarch Eng. & Mfg. Co., Baltimore.
J. W. Paxson Co., Philadelphia, Pa.
W. S. Rockwell Co., New York.
Sheldon's, Limited, Galt, Ont.
Stuart Machinery Co., Winnipeg.
Whiting Foundry Equipment Co., Harvey, Ill.
E. J. Woodison Co., Toronto.

Blast Gauges—Cupola.
Can. Hanson & Van Winkle Co., Toronto.
Columbian Facing Mills Co., Buffalo, N.Y.
Dominion Fdry. Sup. Co., Montreal.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
J. S. McCormick Co., Pittsburg, Pa.
Sheldon's, Limited, Galt.
Frederic B. Stevens, Detroit.
Whiting Foundry Equipment Co., Harvey, Ill.
E. J. Woodison & Co., Toronto.

Brass Melting Furnaces.
Can. Hanson & Van Winkle Co., Toronto.
Columbian Facing Mills Co., Buffalo, N.Y.
Dominion Fdry. Sup. Co., Montreal.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
J. S. McCormick Co., Pittsburg, Pa.
Monarch Eng. & Mfg. Co., Baltimore.
J. W. Paxson Co., Philadelphia, Pa.
W. S. Rockwell Co., New York.
Frederic B. Stevens, Detroit.
Whiting Foundry Equipment Co., Harvey, Ill.
E. J. Woodison & Co., Toronto.

Brushes, Foundry and Core.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Montreal.
B. Greening Wire Co., Hamilton, Ont.
Federal Fdry. Supply Co., Cleveland.
J. S. McCormick Co., Pittsburg, Pa.
Osborn Mfg. Co., Cleveland, O.
J. W. Paxson Co., Philadelphia, Pa.
Frederic B. Stevens, Detroit.
E. J. Woodison & Co., Toronto.

Buffing Machinery.
W. W. Wells, Toronto.

Buffing and Polishing Compositions.
W. W. Wells, Toronto.

Buffs.
W. W. Wells, Toronto.

Burners, Core Oven.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Montreal.
Federal Fdry. Supply Co., Cleveland.
Monarch Eng. & Mfg. Co., Baltimore.
W. S. Rockwell Co., New York.
Frederic B. Stevens, Detroit.
E. J. Woodison Co., Toronto.

Cars, Core Oven.
Can. Hanson & Van Winkle Co.,
Whiting Fdry. Equipment Co., Harvey, Ill.
E. J. Woodison Co., Toronto.
Toronto.
Dominion Fdry. Sup. Co., Montreal.
J. S. McCormick Co., Pittsburg, Pa.
Federal Fdry. Supply Co., Cleveland.
Monarch Eng. & Mfg. Co., Baltimore.

Castings, Malleable.
Can. Malleable Iron Co. Owen Sound.

Cast Iron.
Frankel Bros., Toronto.

Castings, Nickel.
W. W. Wells, Toronto.

Cars, Foundry.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Fdry. Supply Co., Windsor, Ont.
Dominion Fdry. Sup. Co., Toronto.
J. S. McCormick Co., Pittsburg, Pa.
Monarch Eng. & Mfg. Co., Baltimore.
Frederic B. Stevens, Detroit.
Whiting Fdry. Equipment Co., Harvey, Ill.
E. J. Woodison Co., Toronto.

Chain Blocks.
Herbert Morris Chain & Hoist Co., Ltd., Toronto.

Chaplets.
Columbian Facing Mills Co., Buffalo, N.Y.
J. S. McCormick Co., Pittsburg. Pa.
Wells Pattern & Machine Works, Limited, Toronto.

Charcoal.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Toronto.
Frederic B. Stevens, Detroit.
E. J. Woodison Co., Toronto.

Chemicals.
W. W. Wells, Toronto.

Clay Lined Crucibles.
McCulloch-Dalzell Crucible Company, Pittsburg, Pa.

Core Binders.
Detroit Fdry. Supply Co., Windsor, Ont.
Federal Fdry. Supply Co., Cleveland.
J. S. McCormick, Pittsburg, Pa.
J. W. Paxson Co., Philadelphia, Pa.
Robeson Process Co., New Pennington, N.J.
E. J. Woodison Co., Toronto.

Core Box Machines.
Dominion Fdry. Sup. Co., Toronto.
J. S. McCormick Co., Pittsburg, Pa.
J. W. Paxson Co., Philadelphia, Pa.
E. J. Woodison Co., Toronto.

Core Cutting-off and Coning Machine.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Toronto.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
E. J. Woodison Co., Toronto.

Core Compounds.
Can. Hanson & Van Winkle Co., Toronto.
Columbian Facing Mills Co., Buffalo, N.Y.
Dominion Fdry. Sup. Co., Toronto.
J. S. McCormick Co., Pittsburg, Pa.
Federal Fdry. Sup. Co., Cleveland.
J. W. Paxson Co., Philadelphia, Pa.
Robeson Process Co., Pennington, N.J.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto.

Core Machines, Hammer.
Brown Specialty Machinery Co., Chicago, Ill.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.

Core-making Machines.
Berkshire Mfg. Co., Cleveland, O.
Can. Hanson & Van Winkle Co., Toronto.
Columbian Facing Mills Co., Buffalo, N.Y.
Detroit Foundry Supply Co., Windsor, Ont.
J. S. McCormick Co., Pittsburg, Pa.
Federal Fdry. Sup. Co., Cleveland.
J. W. Paxson Co., Philadelphia, Pa.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto.

Core Oils.
Cataract Refining Co., Buffalo, N.Y.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
Holland Core Oil Co., Chicago.
J. S. McCormick Co., Pittsburg, Pa.
Federal Fdry. Sup. Co., Cleveland.
E. J. Woodison Co., Toronto.

Core Ovens.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Toronto.
J. S. McCormick Co., Pittsburg, Pa.
Federal Fdry. Supply Co., Cleveland.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
Monarch Eng. & Mfg. Co., Baltimore.
Oven Equipment & Mfg. Co., New Haven, Conn.
Sheldon's, Limited, Galt, Ont.
Stevens, F. B., Detroit, Mich.
Whiting Foundry Equipment Co., Harvey, Ill.
E. J. Woodison Co., Toronto.

Core Wash.
Columbian Facing Mills Co., Buffalo, N.Y.
J. S. McCormick Co., Pittsburg, Pa.

Core Wax.
United Compound Co., Buffalo, N.Y.
W. D. Beath & Son, Toronto.
J. S. McCormick Co., Pittsburg, Pa.

Cranes, Travelling and Jib.
Curtis Pneumatic Machinery Co., St. Louis, Mo.
Northern Crane Works, Ltd., Walkerville, Ont.
Herbert Morris Crane & Hoist Co. Ltd., Toronto.
Whiting Foundry Equipment Co., Harvey, Ill.

Cranes, Electric and Hand Power.
A. R. Williams Machy. Co., Toronto.
Dominion Bridge Co., Montreal.
Dominion Fdry. Sup. Co., Montreal.
Mussens, Limited, Montreal.
Herbert Morris Crane & Hoist Co. Ltd., Toronto.
Northern Crane Works, Ltd., Walkerville, Ont.
Whiting Foundry Equipment Co., Harvey, Ill.
E. J. Woodison Co., Toronto.

Cranes, Hydraulic.
Dominion Fdry. Sup. Co., Montreal.
Whiting Foundry Equipment Co. Harvey, Ill.
E. J. Woodison Co., Toronto.

Crucibles.
Can. Hanson & Van Winkle Co., Toronto.
Dixon Crucible Co., Joseph, Jersey City, N.J.
Dominion Fdry. Sup. Co., Montreal.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
Seidel, R. B., Philadelphia.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto.
J. S. McCormick Co., Pittsburg, Pa.
McCulloch-Dalzell Crucible Company, Pittsburg, Pa.

Cupolas.
A. R. Williams Machy. Co., Toronto.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Toronto.
Federal Fdry. Supply Co., Cleveland.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
J. S. McCormick Co., Pittsburg, Pa.
Monarch Eng. & Mfg. Co., Baltimore, Md.
Northern Crane Works, Ltd., Walkerville, Ont.
J. W. Paxson Co., Philadelphia, Pa.
Elk Fire Brick Co., Hamilton, Ont.
Sheldon's, Limited, Galt, Ont.
Stevens, F. B., Detroit, Mich.
Whiting Foundry Equipment Co., Harvey, Ill.
E. J. Woodison Co., Toronto.

Cupola Blast Gauges.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Toronto.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
J. W. Paxson Co., Philadelphia, Pa.
Whiting Foundry Equipment Co., Harvey, Ill.

Cupola Blast Piping.
Toronto Blower Co., Toronto.

Cupola Blocks.
Bailey & Son, R., Toronto.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Toronto.
Elk Fire Brick Co., Hamilton, Ont.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
J. W. Paxson Co., Philadelphia, Pa.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto.

Cupola Blowers.
Can. Buffalo Forge Co., Montreal.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Toronto.
J. S. McCormick Co., Pittsburg, Pa.
Monarch Eng. & Mfg. Co., Baltimore, Md.
Sheldon's, Limited, Galt, Ont.
J. W. Paxson Co., Philadelphia, Pa.
Stevens, F. B., Detroit, Mich.
Stuart Machinery Co., Winnipeg.
E. J. Woodison Co., Toronto.

Cupola Linings.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Toronto.
Elk Fire Brick Co., Hamilton, Ont.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
J. S. McCormick Co., Pittsburg, Pa.
J. W. Paxson Co., Philadelphia, Pa.
Stevens, F. B., Detroit, Mich.
Stuart Machinery Co., Winnipeg.
E. J. Woodison Co., Toronto.

Cupola Twyers.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Toronto.
J. S. McCormick Co., Pittsburg, Pa.
J. W. Paxson Co., Philadelphia, Pa.
E. J. Woodison Co., Toronto.

Cutting-off Machines.
Dominion Fdry. Sup. Co., Toronto.
E. J. Woodison Co., Toronto.

Cyanide of Potassium.
W. W. Wells, Toronto.
J. S. McCormick Co., Pittsburg, Pa.

Drying Ovens for Cores.
Oven Equipment & Mfg. Co., New Haven, Conn.
Whiting Foundry Equipment Co., Harvey, Ill.

Dry Kiln Equipment.
Corbett Foundry & Machine Co., Owen Sound, Ont.

Drysand.
Columbia Facing Mills Co., Buffalo, N.Y.

Dynamos.
W. W. Wells, Toronto.

Elevators, Foundry, Hydraulic, Pneumatic.
A. R. Williams Machy. Co., Toronto.
W. D. Beath & Son, Toronto.
Canadian Ingersoll-Rand Co., Ltd., Montreal.
J. S. McCormick Co., Pittsburg, Pa.
Schofield-Holden Machine Co., Ltd., Toronto.
Dominion Fdry. Sup. Co., Toronto.
E. J. Woodison Co., Toronto.

Fans, Exhaust.
Can. Buffalo Forge Co., Montreal.
Can. Hanson & Van Winkle Co. Toronto.
Can. Fairbanks-Morse Co., Montreal.
Dominion Fdry. Sup. Co., Toronto.
J. S. McCormick Co., Pittsburg, Pa.
Stevens, Frederic B., Detroit.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
Sheldon's, Limited, Galt, Ont.
Stuart Machinery Co., Winnipeg.
E. J. Woodison Co., Toronto.

Fillers(Metallic).
Can. Hanson & Van Winkle Co. Toronto.
Dominion Fdry. Sup. Co., Toronto.
Federal Fdry. Supply Co., Cleveland.
Stevens, Frederic B., Detroit.
Shelton Metallic Filler Co., Derby, Conn.
E. J. Woodison Co., Toronto.

Filleta, Leather & Wooden.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Toronto.
Federal Fdry. Supply Co., Cleveland.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
J. S. McCormick Co., Pittsburg, Pa.
E. J. Woodison Co., Toronto.

Fire Brick and Clay.
Bailey & Son, R., Toronto.
Can. Hanson & Van Winkle Co., Toronto.
Columbian Facing Mills Co., Buffalo, N.Y.
Elk Fire Brick Co., Hamilton, Ont.
Dominion Fdry. Sup. Co., Toronto.
Federal Fdry Supply Co., Cleveland.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
J. S. McCormick Co., Pittsburg, Pa.
Monarch Eng. & Mfg. Co., Baltimore.
J. W. Paxson Co., Philadelphia, Pa.
Stevens, Frederic B., Detroit.
Stuart Machinery Co., Winnipeg.
E. J. Woodison Co., Toronto.
Whitehead Bros. Co., Buffalo, N.Y.

Fire Sand.
Whitehead Bros. Co., Buffalo, N.Y.

Flasks, Snap, Etc.
Berkshire Mfg. Co., Cleveland, O.
Dominion Fdry. Sup. Co., Toronto.
Can. Hanson & Van Winkle Co., Toronto.
Can. Hanson & Van Winkle Co., Toronto.
Columbian Facing Mills Co., Buffalo, N.Y.
Dominion Fdry. Sup. Co., Toronto.
Federal Fdry Supply Co., Cleveland.
Guelph Pattern Works, Guelph, Ont.
J. S. McCormick Co., Pittsburg, Pa.
J. W. Paxson Co., Philadelphia, Pa.
Sterling Wheelbarrow Co., West Allis, Wis.
E. J. Woodison Co., Toronto.

Fonndry Coke.
Baird & West, Detroit.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto

Foundry Equipment.
A. R. Williams Machy. Co., Toronto.
W. D. Beath & Son, Toronto.
Can. Hanson & Van Winkle Co., Toronto.
Columbian Facing Mills Co., Buffalo, N.Y.
Federal Fdry Supply Co., Cleveland.
Dominion Fdry. Sup. Co., Toronto.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
J. S. McCormick Co., Pittsburg, Pa.
Monarch Eng. & Mfg. Co., Baltimore.
Northern Crane Works, Walkerville, Ont.
J. W. Paxson Co., Philadelphia, Pa.
Stevens, F. B., Detroit, Mich.
Stuart Machinery Co., Winnipeg.
Sterling Wheelbarrow Co., Wisconsin.
Whiting Foundry Equipment Co., Harvey, Ill.
E. J. Woodison Co., Toronto.

Fonndry Parting.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Toronto.
Federal Fdry. Supply Co., Cleveland.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
J. S. McCormick Co., Pittsburg, Pa.
J. W. Paxson Co., Philadelphia, Pa.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto.
Whitehead Bros. Co., Buffalo, N.Y.

Fonndry Facings.
Can. Hanson & Van Winkle Co., Toronto.
J. S. McCormick Co., Pittsburg, Pa.
Columbian Facing Mills Co., Buffalo, N. Y.
J. S. McCormick Co., Pittsburg, Pa.
Dominion Fdry. Sup. Co., Toronto.
Federal Fdry. Supply Co., Cleveland.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
Monarch Eng. & Mfg. Co., Baltimore, Md.
J. W. Paxson Co., Philadelphia, Pa.
E. J. Woodison Co., Toronto.
Stevens, F. B., Detroit, Mich.
Whitehead Bros. Co., Buffalo, N.Y.

Furnace Lining.
Can. Hanson & Van Winkle Co., Toronto.
Columbian Facing Mills Co., Buffalo, N. Y.
Dominion Fdry. Sup. Co., Toronto.
Elk Fire Brick Co., Hamilton, Ont.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
Hawley Down Draft Furnace Co., Easton, Pa.
J. S. McCormick Co., Pittsburg, Pa.
Monarch Eng. & Mfg. Co., Baltimore, Md.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto.

Furnaces.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Toronto.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
Hare Engineering Co., Toronto.
Hawley Down Draft Furnace Co., Easton, Pa.
J. S. McCormick Co., Pittsburg, Pa.
Monarch Eng. & Mfg. Co., Baltimore, Md.
J. W. Paxon Co., Philadelphia, Pa.
Stevens, F. B., Detroit, Mich.
Whiting Foundry Equipment Co., Harvey, Ill.
E. J. Woodison Co., Toronto.

Furnaces, Brass.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Toronto.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
Hare Engineering Co., Toronto.
Hawley Down Draft Furnace Co., Easton, Pa.
J. S. McCormick Co. Pittsburg, Pa.
Monarch Eng. & Mfg. Co., Baltimore, Md.
J. W. Paxson Co., Philadelphia, Pa.
W. S. Rockwell Co., New York.
Stevens, F. B., Detroit, Mich.
Whiting Foundry Equipment Co., Harvey, Ill.
E. J. Woodison Co., Toronto.

Graphite Products.
Federal Fdry. Supply Co., Cleveland.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
Jonathan Bartley Crucible Co., Trenton, N.J.
J. S. McCormick Co., Pittsburg, Pa.
McCulloch-Dalzell Crucible Company, Pittsburg, Pa.

Hoisting and Conveying Machinery.
A. R. Williams Machy. Co., Toronto.
W. D. Beath & Son, Toronto.
Northern Engineering Wks., Detroit.
Whiting Foundry Equipment Co., Harvey, Ill.
Herbert Morris Crane & Hoist Co., Ltd., Toronto.

Hoists, Electric, Pneumatic.
A. R. Williams Machy. Co., Toronto.
W. D. Beath & Son, Toronto.
Canadian Ingersoll-Rand Co., Ltd., Montreal.
Cleveland Pneumatic Tool Co. of Can., Toronto.
Curtis Pneumatic Machinery Co., St. Louis, Mo.
Herbert Morris Crane & Hoist Co., Ltd., Toronto.
Dominion Fdry. Sup. Co., Toronto.
Northern Crane Works, Walkerville.
E. J. Woodison Co., Toronto.
Whiting Foundry Equipment Co., Harvey, Ill.

Hoists, Hand, Trolley.
Dominion Fdry. Sup. Co., Toronto.
Northern Crane Works, Walkerville.
E. J. Woodison Co., Toronto.
Herbert Morris Crane & Hoist Co., Ltd., Toronto.
Whiting Foundry Equipment Co., Harvey, Ill.

Hose and Conplings.
Can. Niagara Device Co., Bridgeburg, Ont.

Ingot Metals.
Frankel Bros., Toronto.

Iron Cements.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Toronto
Federal Fdry. Supply Co., Cleveland.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
J. W. Paxson Co., Philadelphia, Pa.
Smooth-On Mfg. Co., Jersey City.
Stevens, F. B., Detroit, Mich.

Iron Filler.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Toronto.
Federal Fdry. Sup. Co., Toronto.
J. S. McCormick Co., Pittsburg, Pa.
Federal Fdry. Supply Co., Cleveland.
J. W. Paxson Co., Philadelphia, Pa.
Smooth-On Mfg. Co., Jersey City.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto.

Jersey Sand.
Columbian Facing Mills Co., Buffalo, N. Y.

Ladles, Fonndry.
Can. Hanson & Van Winkle Co., Toronto,
Dominion Fdry. Sup. Co., Montreal.
Federal Fdry. Supply Co., Cleveland.
J. S. McCormick Co., Pittsburg, Pa.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
Northern Crane Works, Walkerville, Ont.
Monarch Eng. & Mfg. Co., Hamilton, Ont.
J. W. Paxson Co., Philadelphia, Pa.
Stevens, F. B., Detroit, Mich.
Whiting Foundry Equipment Co., Harvey, Ill.
E. J. Woodison Co., Toronto.

Ladle Heaters.
Hawley Down Draft Furnace Co., Easton, Pa.
J. S. McCormick Co., Pittsburg, Pa.

Ladle Stoppers, Ladle Nozzles, and Sleeves (Graphite).
J. W. Paxson Co., Philadelphia, Pa.
Seidel, R. B., Philadelphia.
McCulloch-Daizell Crucible Company, Pittsburg, Pa.

Melting Pots.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Toronto.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
Monarch Eng. & Mfg. Co., Baltimore, Md.
Stevens, F. W., Detroit, Mich.
E. J. Woodison Co., Toronto.

Millville Gravel.
Columbian Facing Mills Co., Buffalo, N. Y.

Metallurgists.
Canadian Laboratories, Toronto.
Charles C. Kawin Co., Toronto.
Frankel Bros., Toronto.
Toronto Testing Laboratories, Toronto.
M. & L. Samuel Benjamin C., Toronto

Mixers.
J. S. McCormick Co., Pittsburg, Pa.
Standard Sand & Machine Co., Cleveland, O.
Sand Mixing Machine Co. of Can., Brantford.
J. W. Paxson Co., Philadelphia, Pa.

Molders' Tools.
Can. Hanson & Van Winkle Co., Toronto.
Wr. Dobson, Canastota, N.Y.
Dominion Fdry. Sup. Co., Toronto.
Frederic R. Stevens, Detroit.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
J. S. McCormick Co., Pittsburg, Pa.
E. J. Woodison Co., Toronto.

Molding Machines.
Berkshire Mfg. Co., Cleveland, O.
Can. Hanson & Van Winkle Co., Toronto.
Cleveland Pneumatic Tool Co. of Can., Toronto.

J. S. McCormick Co., Pittsburg, Pa.
Tabor Mfg. Co., Philadelphia.
Stuart Machinery Co., Winnipeg.
E. J. Woodison Co., Toronto.

Molding Sand.
Can. Hanson & Van Winkle Co., Toronto.
T. E. Coupe, Toronto.
Dominion Fdry. Sup. Co., Toronto.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
Interstate Sand Co., Zanesville, O.
J. W. Paxson Co., Philadelphia, Pa.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto.
Whitehead Bros. Co., Buffalo, N.Y.

Molding Sifters.
Whitehead Bros. Co., Buffalo, N.Y.

Ovens for Core-baking and Drying.
Hare Engineering Co., Toronto.
J. S. McCormick Co., Pittsburg, Pa.
Oven Equipment & Mfg. Co., New Haven, Conn.

Oxy-Acetylene Welding.
W. D. Beath & Son, Toronto.

Oil and Gas Furnaces.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Toronto.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
Monarch Eng. & Mfg. Co., Baltimore, Md.
J. W. Paxson Co., Philadelphia, Pa.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto.

Patterns, Metal and Wood.
Wells Pattern & Machine Works, Limited, Toronto.
Guelph Pattern Works, Guelph, Ont.

Pattern Shop Equipment.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Sup. Co., Montreal.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
J. S. McCormick Co., Pittsburg, Pa.
J. W. Paxson Co., Philadelphia, Pa.
Stevens, F. B., Detroit, Mich.
Hamilton Pattern Works, Hamilton.
Stuart Machinery Co., Winnipeg.
E. J. Woodison Co., Toronto.

Pig Iron.
Frankel Bros., Toronto.
M. & L. Samuel Benjamin C., Toronto

Phosphorizers.
J. S. McCormick Co., Pittsburg, Pa.
McCulloch-Dalzell Crucible Company, Pittsburg, Pa.
Whitehead Bros. Co., Buffalo, N.Y.

Pinmbago.
Can. Hanson & Van Winkle Co., Toronto.
Columbian Facing Mills Co., Buffalo, N. Y.
Dominion Fdry. Sup. Co., Toronto.
J. S. McCormick Co., Pittsburg, Pa.
J. W. Paxson Co., Philadelphia, Pa.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto.

Plating and Polishing Supplies.
Can. Hanson & Van Winkle Co., Toronto.
Dominion Fdry. Supply Co., Toronto.
W. W. Wells, Toronto.
E. J. Woodison Co., Toronto.

Pnenmatic Paint Spray.
Can. Niagara Device Co., Bridgeburg, Ont.

Polishing Wheels.
W. W. Wells, Toronto.

Ramming Plates and Machines.
Can. Hanson & Van Winkle Co., Toronto.
Canadian Ingersoll-Rand Co., Limited, Montreal.
Dominion Fdry. Sup. Co., Montreal.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto.

Returns.
Jonathan Bartley Crucible Co., Trenton, N.J.

Riddles.
Can. Hanson & Van Winkle Co., Toronto.
Canada Wire & Iron Goods Co., Hamilton, nt.
Hamilton Facing Mill Co., Ltd., Hamilton, Ont.
J. S. McCormick Co., Pittsburg, Pa.

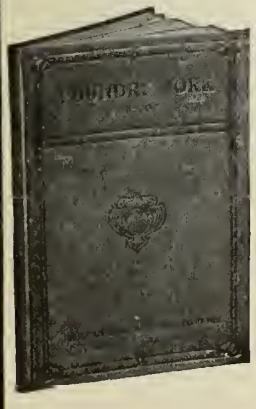
Make One Barrel Do What Two Barrels Did Before

THE minute you install one Globe Tumbling Barrel you can pension two of your old-fashioned horizontal barrels and still do a wider variety of work—and do it a great deal better and many times faster.

GLOBE TUMBLING BARRELS



save time because they don't have to be stopped for filling, emptying or inspecting of the work. They save floor space, because they stand vertically and occupy little room—and they save money, because they require a smaller investment in barrels.

Eight stock sizes, $50 to $170. Our Booklet 2 contains useful information on tumbling — shows the different styles of Globe Barrels and tells what each will do. Write for a free copy to-day.

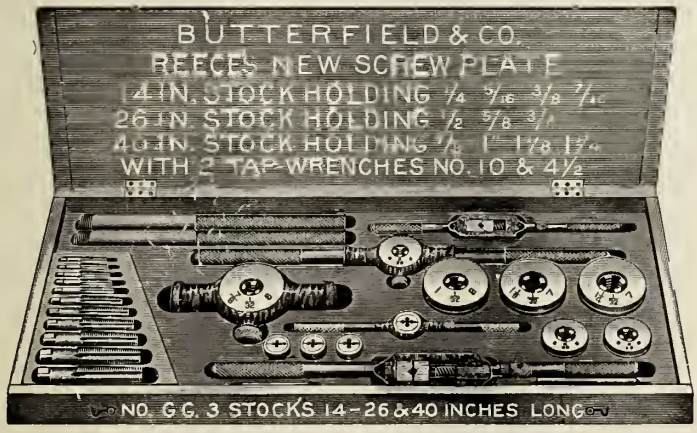
Speed in changing, accuracy of cut, quality of cut, and solidity of bed makes this Lathe an Economical Producer

All parts taking strain are of ample excess size and all bearings are large.

The gap is solidly supported, and is of extra width and depth.



You can instal one or a battery of these **Gap Lathes**, to swing from 30 to 48 inches and in any length of bed. **Write us for full particulars.**

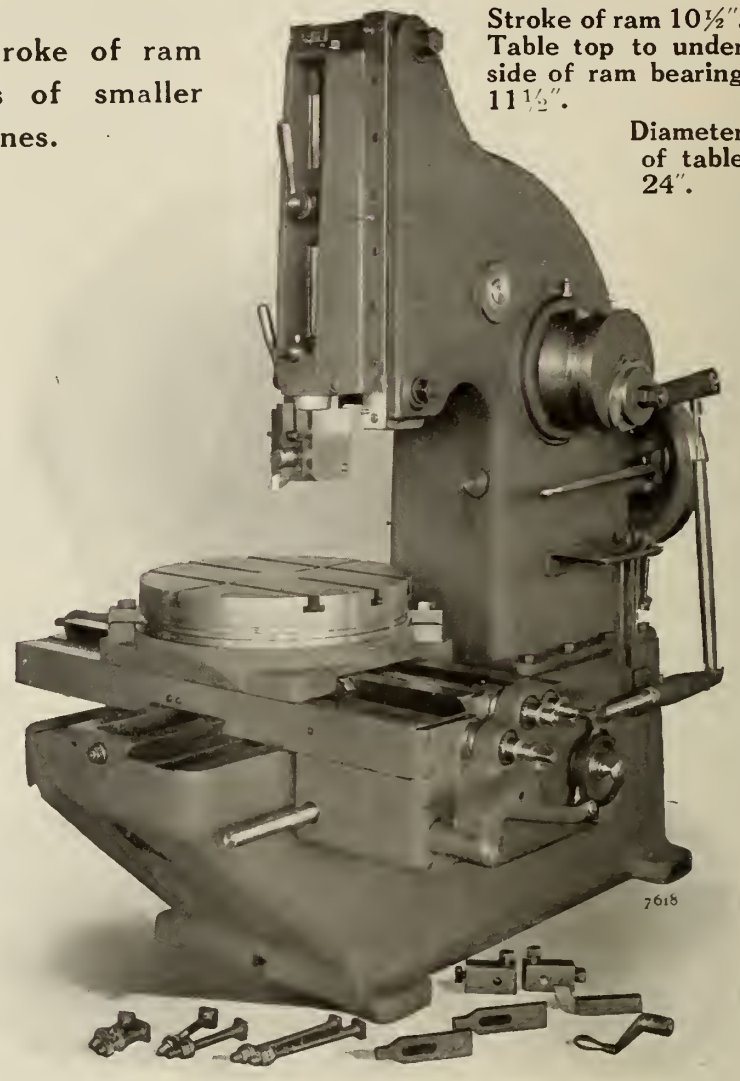
SHAPERS C.M.C. SHAPERS

24 x 30 Back Geared Crank Shaper
with down feed to head



We build the highest grade shapers built in Canada.
A strong statement backed by a strong machine.
Built in two sizes:—16 in. x 20 in. and 24 in. x 30 in.

Described in our Bulletins No. 1015 and No. 1016, sent on request.

Canada Machinery Corporation Limited
GALT, ONTARIO

Larger Size Vertical Shaper

New Model Machine with 10½″ stroke of ram embodying all the novel features of smaller shaper in addition to several new ones.

Stroke of ram 10½″. Table top to under side of ram bearing 11½″.

Diameter of table 24″.

That work which you have had to do in an unsatisfactory, inefficient manner because the 6″ Vertical Shaper was too small to handle it, can now be done on the

New 10″ P. & W. Vertical Shaper

Differs from 6″ Machine in some features.

Power Rotary Feed. The 10″ Vertical Shaper is provided with power rotary as well as longitudinal and transverse power feeds.

Compact Feed Mechanism. The entire feed mechanism is self-contained in one compact unit on the right side of the saddle. The longitudinal, transverse and rotary power feeds are conveniently engaged, disengaged and reversed from this unit.

Powerful Worm and Wheel Drive.

Power is applied to the ram through a powerful worm and worm-wheel drive.

Why the Vertical Shaper Should Appeal to You

In the first place, it is a machine of great range and you should never have any difficulty in keeping it busy. It will handle efficiently both slotting machine and horizontal shaper work in addition to work for which its distinctive features make it particularly adapted.

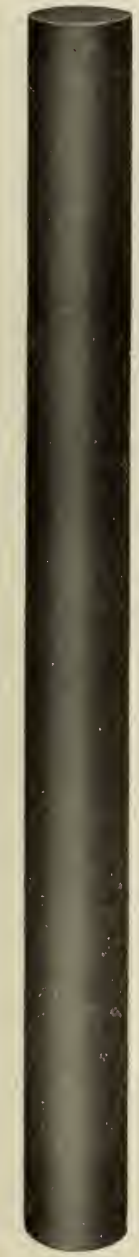
With the angular adjustment of the ram, this machine is in a class by itself on die work, convex, concave, and irregular surfaces.

Swiveling ram head enables tool to be set in most convenient position; also various sides of work can be machined at one setting, and with much greater accuracy than possible on horizontal shaper.

Although machine is proportioned to give unquestioned stability and provided with ample power for every requirement, it is a precision tool of great accuracy. The cutting stress holds the table and slides together, and there is no tendency for the table to yield as on the horizontal shaper.

The entire control is within easy reach and conveniently operated.

Ram may be started and stopped independent of driving motor by means of clutch.



Write for new 12-page circular "Vertical Shapers"

Pratt & Whitney Company, Hartford, Conn., U.S.A.

SALES AGENTS FOR CANADA:

THE CANADIAN FAIRBANKS-MORSE CO., Limited, Montreal, Toronto, Vancouver, Winnipeg, St. John, Calgary

Three Things Make Wilt Twist Drills the Standard of Drill Excellence.

Rough Stock

Stock

The stock Wilt Twist Drills come from is the finest, most carefully selected, most accurately tested steel that can be bought.

It is **steel with a pedigree.** Steel that has a long record of worthy performances behind it.

Machining

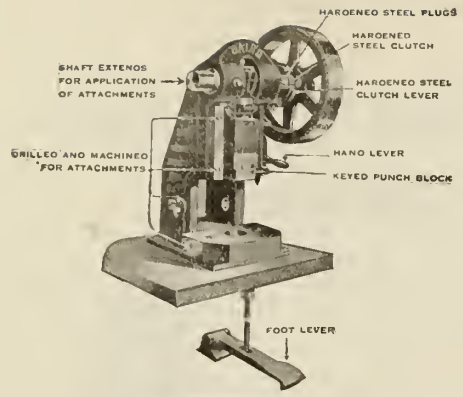
Wilt Twist Drills are machined complete at a single chucking—not as has been heretofore necessary, in five or six different machining processes.

The rough stock goes into the automatic machine and comes out a perfectly cut drill.

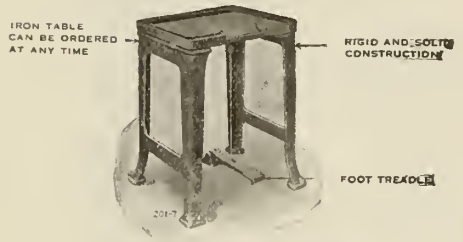
Hardening Process

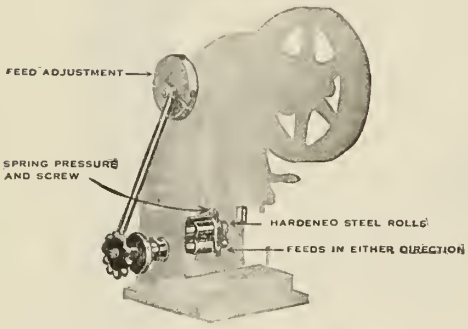
Wilt Twist Drills are **perfectly** hardened. Electric furnaces run by the most skilled operators in their trade insure hardening of a scientific accuracy.

No wonder Wilt Twist Drills stand up better, last longer and almost never break down under strain.

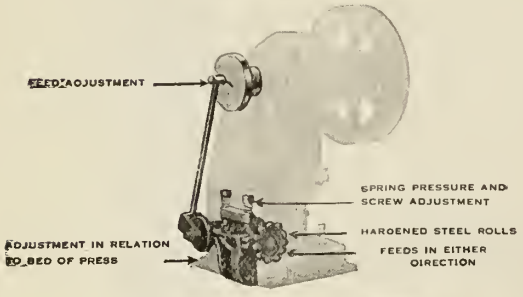


Test them on your hardest job.

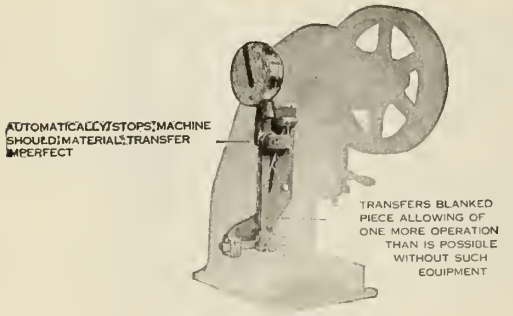




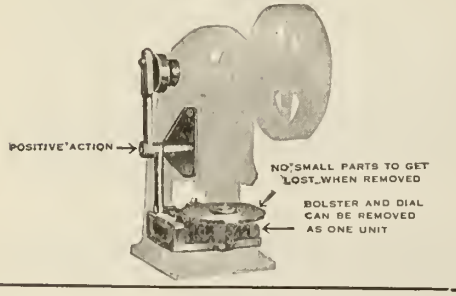
Finished Drill



The Wilt Twist Drill Company of Canada, Limited



Walkerville **Ontario**



$58 OPENS THE WAY FOR FULL AUTOMATIC MACHINERY

Our Open Back Power Bench Press No. 201 has been reduced to the very elementals of flexibility in equipment. Either Single or Double-Action Presses can be supplied.

The Plain Press can be purchased—as illustrated, to be fastened to a bench. Or a complete Press with Iron Table and Legs can be ordered. The Table can be ordered with the Press or it can be ordered at any time in the future. Both Press and Table are standardized.

A Back Roll Feed can be ordered with the Press or it can be ordered whenever requirements make it necessary. This Feed takes the metal from a reel and automatically draws it under the tool ready to be operated upon. It feeds in either direction, front to back or back to front, and by adjustment moves the metal forward any predetermined distance at each operation. There is no chance of accident when this attachment is applied as it takes away the necessity of hand operation and makes the Press a Full Automatic Labor Saving Machine.

A Side Roll Feed can be ordered with the Press or at any future time. This takes the metal from a reel in a similar manner to Back Roll Feed, but being attached to side of Press feeds the metal across the bed from right to left or left to right as may be desired. It allows of greater operating space for tools as the metal travels across the greatest width of bed and punch block. Rolls can be adjusted in relation to bed of press.

A Transfer and Automatic Stop Attachment can be ordered with Press or at some later date. This is used in connection with Back Roll Feed. After Press has reached the limit of operation under regular equipment the Transfer carriers or transfers the blank into position for one more operation. It allows one additional operation without rehandling to what would be possible without such attachment.

A Dial Attachment may be ordered with the Press or at any future time. A Dial Attachment will handle small partly finished objects with speed where it would be both dangerous and slow to feed directly to the tool by hand. Lift Pin for Dial and other variations of attachments making them suitable for particular purposes can be fitted.

Bulletin No. 201 gives Full Details and can be had for the asking.

Do You Grind High Speed Steel Tools?

If so, you know how "skin softening," burning and checking are prevented by a free and cool-cutting wheel—a wheel that will produce greater output without sacrificing finish.

NORTON ALUNDUM GRINDING WHEELS

are made of special "tempers" for use on high-speed steels. Our ability to temper the toughness of Alundum will help you to get better results on alloy steels.

When Thinking of Pipe-Threading, Think of BIGNALL & KEELER MACHINES

When deciding on a new machine it is well to consider what it will be worth in ten or fifteen years, and what it will cost to keep it in good running order during its natural life.

BIGNALL & KEELER machines are not built just for a day—to-morrow is taken into consideration also. The belt-driven machines are constructed with a view of changing to direct motor-driven at any future time.

Cut shows the No. 4 P.D.Q.C. cutting from 1 to 4 inches. It has the quick-acting chuck, gear-box, cut-off, and reaming attachment. The quick-chuck can be operated while running, therefore, when the machine is set for a size of pipe it need not be stopped until pipe of a different size is to be threaded.

GARVIN NO. 2-A (ALL FEEDS) Universal Milling Machine

IS THE MACHINE FOR YOUR TOOL-ROOM——RIGID AND ACCURATE

GARVIN No. 2-A Universal Milling Machine
(Automatic Feeds in all Directions)
Use Code - - - ANIMUS

Power Feed with reverse and automatic trip is provided in all directions, table, in and out and up and down. The feed movements are all controlled by one handle, with which the knee, saddle or slide can be started, stopped and reversed. The table has an independent trip handle in addition.

Ten positive Feed Gear Changes are secured, doubled to twenty when back-gears are used. The accelerated feed of table is received, when large diameter cutters are being used and the spindle is running slow. The Feed can be changed while machine is in cut.

Machine is equipped with our Double-Geared Dividing Head, our

SOLID TOP EXTENDED (Patented) KNEE

and many other valuable features exclusive to GARVIN Milling Machines.

DIMENSIONS

Automatic Table Feed	25 in.
Automatic Feed of Saddle	8 in.
Automatic Feed of Knee	18 in.

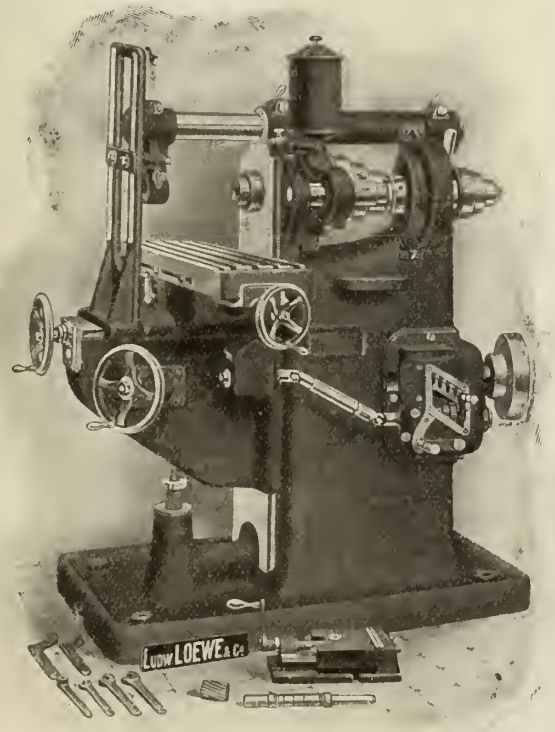
KEMPSMITH

No. 3 Universal

It is big enough and powerful enough to pull high-speed cutters to the limit.



The bearing surfaces and spindle boxes are so liberally designed that it will do this work without vibration or chatter. It is so carefully constructed and so thoroughly tested that we guarantee its accuracy to be of the very highest.

It is so simple in its design and so convenient in its operation that your workmen just naturally get the very highest production out of it without effort.

We use semi-steel castings in table, saddle, knee and column, which gives us tough, close-grained metal at all points of wear and strain.

You should investigate this machine before placing your order. Write us to-day.

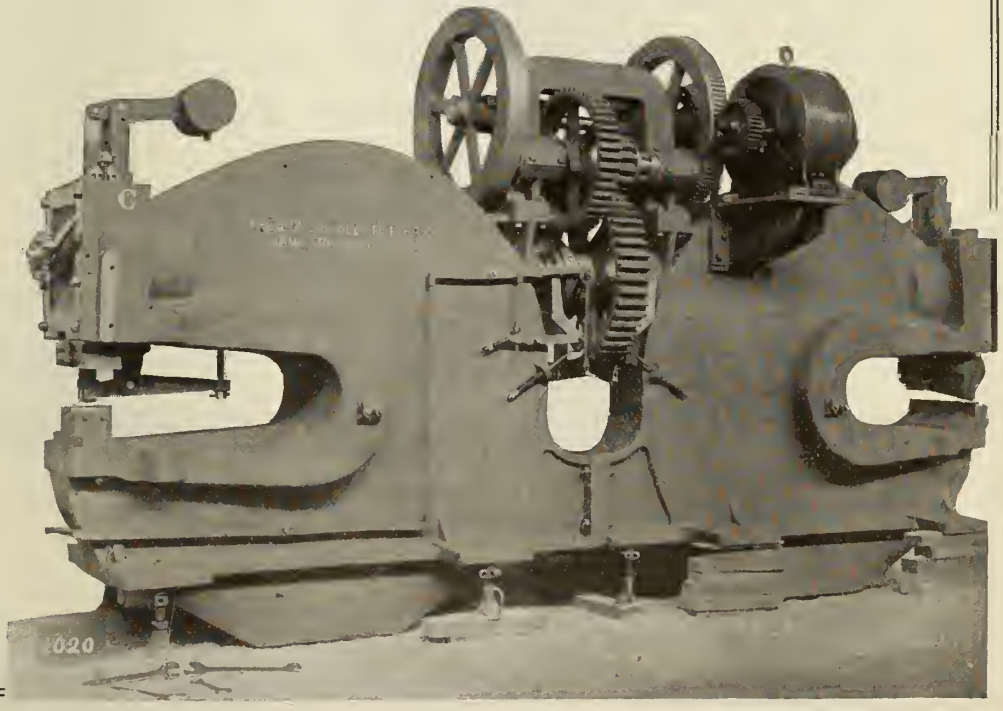
A MODERN SAVER

of Time, Money, Space and Labor

Here is a machine that is well worthy of your attention—our **"Double C Punch and Shear"** with 48-inch throat.

This machine has an enormous capacity for doing **rapid, accurate** and **economical** work of **quality.**



Let us send full description. If you are interested in up-to-date money-saving machinery you cannot afford to remain uninformed.

We manufacture a complete line of

LABOR-SAVING MACHINERY

all kinds and sizes, for

Structural Iron Works, Railroad and Locomotive Shops, Boiler Shops, Rolling Mills, Agricultural Implement and Plow Shops, etc.

CLEVELAND SAND RAMMERS

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING.

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts—Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

BOWES AIR HOSE COUPLINGS

Over 1,000,000 in General Use.

Bowes Couplings are instantly connected or disconnected.

Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

In Stock : — RIVETING HAMMERS, DRILLS, REAMING, TAPPING AND FLUE - ROLLING MACHINES, CORNER DRILLS, PORTABLE AND BENCH GRINDERS, ETC.

Catalog No. 12 mailed on request.

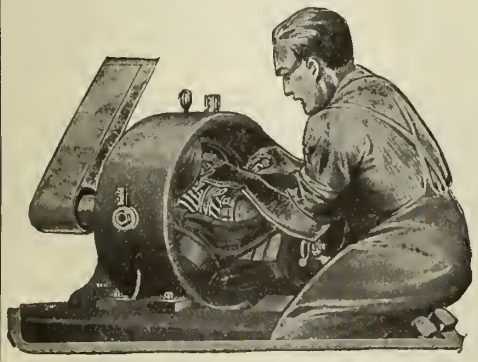
Bliss Inclinable Power Presses



Combine rigidity, accuracy, simplicity and ease of operation.

The bodies are inclinable and convenient for handling dies and material; they combine a strength and rigidity that minimizes the maintenance costs of both machines and tools. The slides, fitted with positive knockouts, are long and well gibbed.
Built in eighteen sizes, they are adapted for nearly all the operations in the manufacture of tin cans, pieced tinware, metal packages, electrical goods, brass goods, trimmings, etc. Catalog No. 1G on request.

THE CAMEL HAIR BELTING

As a Power Transmitter is Cheapest—Why?

BECAUSE! It lasts longer than any other belt on the market.
BECAUSE! It slips just one-half that of any other belting.
BECAUSE! It will run equally well in damp, wet or a dry atmosphere.
BECAUSE! It is less affected by acid fumes and high temperatures than any other Belting.
BECAUSE! It is uniform in thickness and runs true.
BECAUSE! Of its great strength—almost twice that of best oak-tanned double leather.
BECAUSE! It requires much less attention than other styles of belting.
BECAUSE! The stretch comes out quickly and after taking up once or twice (according to load and nature of run) requires little or no more attention.
BECAUSE! It transmits more power than any other belting.

Put Your Factory Equipment Needs Up to

GOODYEAR
TORONTO

Goodyear factory equipment has established a new efficiency standard in large and small manufacturing concerns throughout the Dominion.

Where "price" used to be the basis of purchase in these places, it is now *SERVICE.*

Belting now is bought on *service rendered* and *operating economy effected.* So is Hose. So are Packing and Valves. Manufacturers are buying Goodyear equipment because they know that they can get the very article for the very need—based on an actual investigation and study of the very requirement.

And in buying factory equipment this Goodyear *efficiency service* is yours without extra charge.

Belting

Transmission Belts that deliver all the power without undue strain on the pulleys and "coal pile." Each belt made to meet the very purpose for which it is designed. Each made for "pulling" power—without unnecessary bulk and weight.

"Leg" and "Bucket" Conveyor Belts. For carrying heaviest loads—coal, gravel, ore, grain, etc. Each made with the exact surface for the exact purpose. Carry the load with least wear and tear. Day in and day out utility insures real economy.

Special Brick Conveyor Belt—with oil-resisting stock face. Unaffected by oil that is shed by machine.

Tell Goodyear your belt needs. Learn beforehand of just the belt, *and why.* Then, no after regrets—no after expense.

Hose

Steam Hose, Air Drill Hose, Agricultural Hose, Hose for gas, acids, and hot and cold liquids. Each made with the special inner lining for its particular purpose. Hence, longer life—*greater service.*

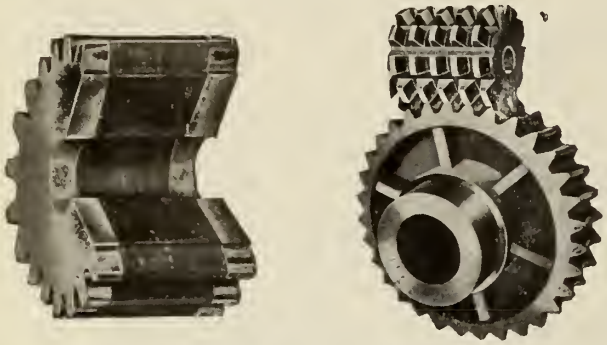
Let Goodyear tell you of just the hose you need. Perhaps you have not thought much about it before. But it's a vital matter just the same, if you value time and money saving. Goodyear has already solved just such hose problems as yours.

Packing and Valves

Poor packing may serve today—and tomorrow. But it soon gives out. That means lost time—lost motion—expense.

Goodyear Packing gives you a tight joint whether the pressure is air, hot or cold water, or superheated steam. Will not blow out. Unaffected by expansion or contraction. Won't flow under intense heat or pressure.

Goodyear Valves are made for all purposes—from cold water to acids—low pressure and high pressure, air and steam. We will tell you the "why" of just the Goodyear packing and valves for your every purpose.



Use This Free Service Asking questions about your belting, hose, packing and valve needs, costs you nothing—involves no obligation. The Goodyear Efficiency Bureau will be glad to confer with you at any time. Write today.

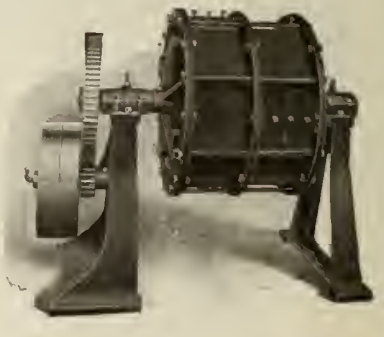
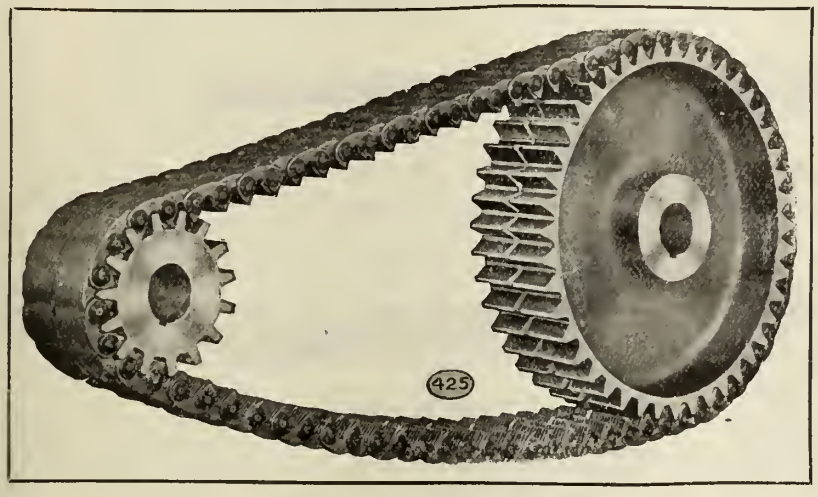
The Abbott Way



is the logical way to finish all your small parts.

Whether they be of brass, steel, nickel, aluminum or any other material, the carbonized steel balls inside an Abbott Tumbling Barrel will give them a smooth, hard, wear-resisting finish—will make them look better than if they were polished—at a fraction of the cost.

The "Abbott" finishes in hundreds, needs no materials except the glass-hard steel balls—which never wear out—and a little soapy water, and requires but a few moments of an unskilled operator's time.



If you're still finishing by the old methods you're wasting time.

You'd better send us some samples for burnishing and write for our free book.

The Abbott Ball Company
1047 Elmwood Avenue Hartford, Conn.

Renold Patent Silent Chains

The advantages are:—

SAVING IN SPACE.

The chain drive only occupies one-third of the space occupied by the belt, as with chain drive it is possible to place the motor close to the shaft without any sacrifice of efficiency.

SAVING IN POWER.

Chain Drives being positive, there is no initial tension as with belts, and therefore none of the journal friction so caused. Consequently all the power is applied economically.

REGULARITY OF OUTPUT.

With the chain the speed ratio is perfectly definite under all conditions of load. This ensures a steady output with not only an increase in quantity but generally an improvement in quality.

Many other advantages given in illustrated catalogue sent on request.

The New Steel Car Shops of the C.P.R. at Angus, Montrea

By L. C. Ord *

The accompanying article formed the subject of a paper read before the Canadian Society of Civil Engineers, Montreal, on April 30, and by its contents indicates not only the faith of the C.P.R. management in the greater serviceability of steel cars, but that corporation's enterprise in equipping themselves to produce them as far as possible to fill their own requirements.

THE Canadian Pacific Railway decided to build at their Angus shops, Montreal, for the construction of steel passenger and freight cars, a plant having a capacity for building ten passenger cars per month and eight freight cars per day. At the time the steel freight car shop was built many thousands of steel frame freight cars had been built by contracting shops, both in the United States and in Canada, to the same design as the cars for which the new shops were intended.

As it was anticipated that the greater number of the cars built would be steel frame box cars, the design and lay-out of the freight shop was considered solely with reference to this type of car, in order that the work might be done as cheaply as possible. In designing the shop, 2,750 sq. ft. of floor area was allowed per car per day. To prevent the overcrowding which is common in most steel freight car shops and to allow for the greater amount of room taken up by spacing punches, larger machine room was provided. The final floor area for the freight shop was made 41,785 sq. ft., and the area of the machine shop 22,069 sq. ft., less 7,265 sq. ft. which was set apart for machining and assembling steel centre sills for repair work, giving a total area of 14,795 sq. ft., available for machines. The area of the assembling portion of the freight shop was 9,170 sq. ft., while the erecting area was 17,820 sq .ft.

At Angus a shop already existed for building trucks for both passenger and freight cars, and the trucks are therefore erected, assembled and delivered to the steel shop complete in every respect. There was also a freight shop for building and painting wooden freight cars. In this wood shop, therefore, the steel cars have the floors, lining and roofs applied, except in the case of some all-steel roofs. The existing large blacksmith shop made it convenient to arrange that no forging or hot bending work of any sort should be handled in the steel shop, the necessary rivet furnaces being the only ones in the steel shop.

Lay-out Features.

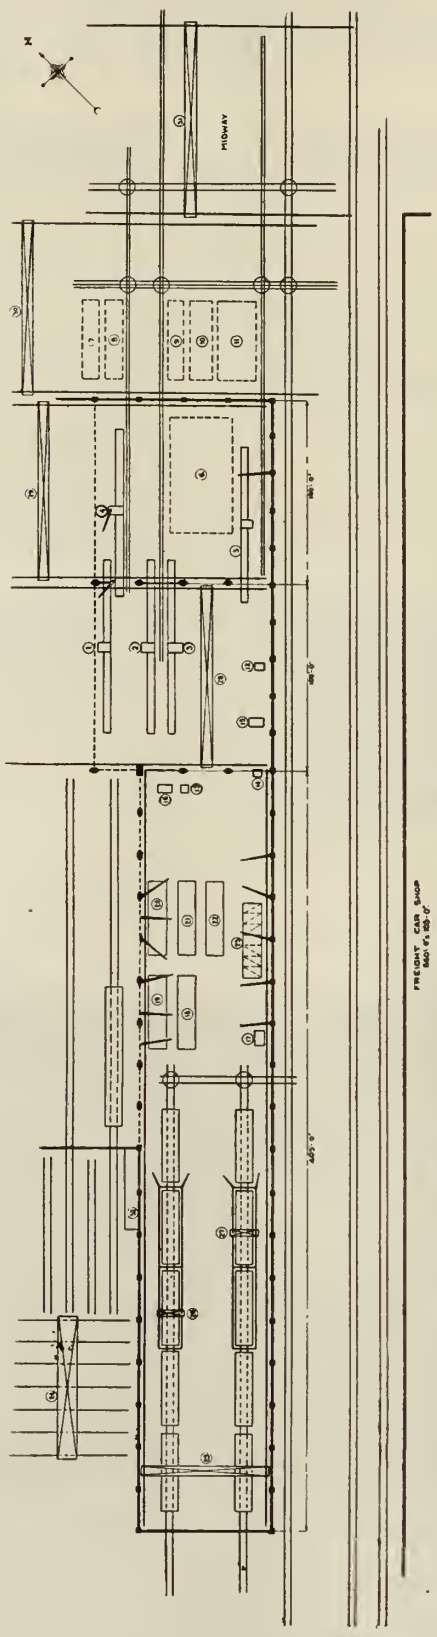
In Fig. 1 is shown the general lay-out of the section of Angus plant for the convenient location of the wood mill and wooden freight car shop for the finishing and painting of the steel frame box cars, also of the truck shop and of the lorry and overhead crane arrangement for handling the supply of material from the truck and blacksmith shops. The steel shop proper consists of two 100-ft. bays running parallel with the front of the shop, and, at right angles to this, one 72-ft. bay 405 ft. long. The passenger shop erecting section is composed of four 27 ft. 6 in. bays 202 ft. 6 in. long, running at right angles to the hundred-foot bays and parallel to the freight section.

The crane service comprises a 10-ton traveling crane 96 ft. 3 in. span on a runway 309 ft. long in front of the shop, covering the material section and parallel to the cranes in the shop and of the same height and span. Inside the shop there is a 10-ton crane 96 ft. 3 in. span in each of the 100 ft. bays. These cranes all have a headroom of 27 feet.

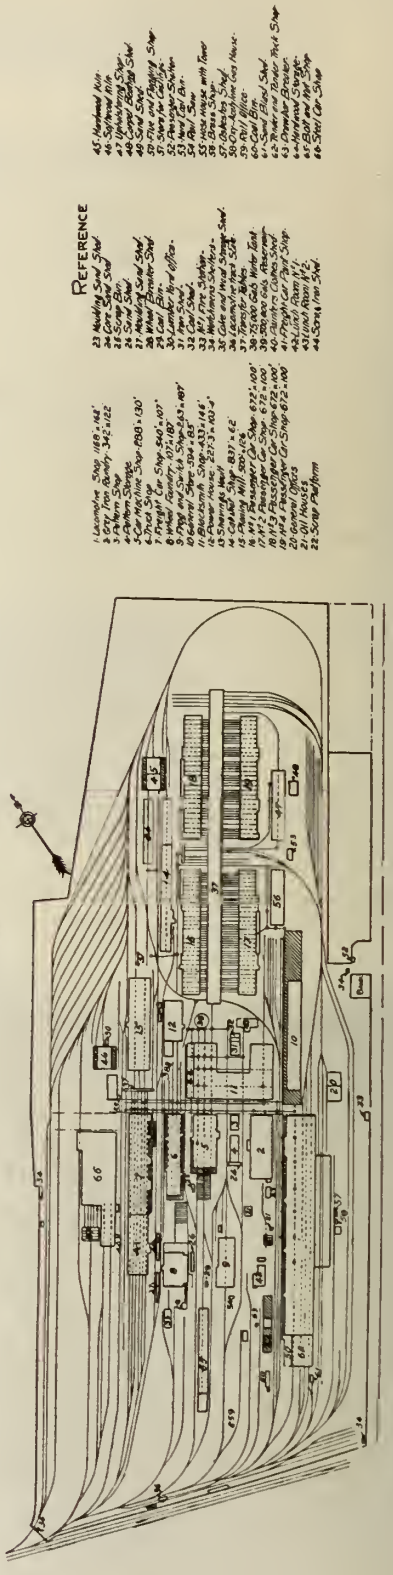
In the erecting section on the freight side there is a crane of 10-ton capacity 67 ft. 7 in. span with a head room of 35 ft. 6 in. In the passenger shop four traveling cranes 24 ft. 10 in. span of 2-

*General Car Inspector, C.P.R., Montreal.

GENERAL VIEW OF STEEL FREIGHT CAR ERECTING SHOP.



ton capacity with 20 ft. headroom are used. They are for the handling of material for the passenger car work and are operated from the ground. A noticeable feature is that these runways are carried into the main shop about 8 ft. under-running the overhead traveling crane to assist in the transfer of material from one crane to another.



The building is steel with brick walls, steel sash being used, and care has been taken to provide a large amount of light, the area of light being approximately thirty per cent. of the total wall space.

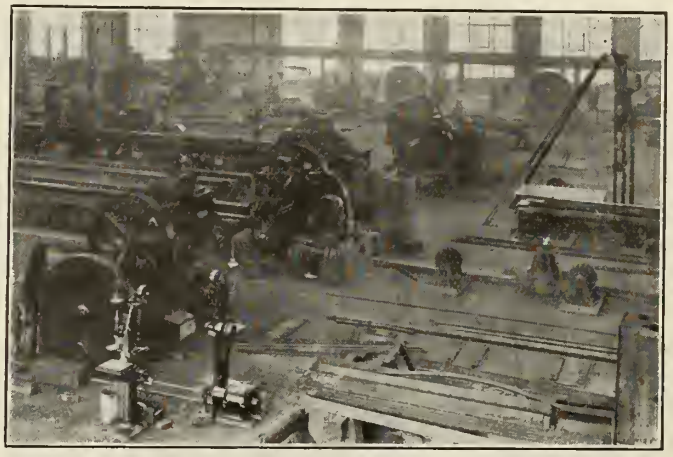
The floor in the shop is mastic throughout and is an asphalt composition in two 5/8-in. coats, the top being a wearing and the bottom a cushion coat or a concrete base 4 inches thick. After considerable use of this type of floor in various parts of the plant, a floor of rather harder consistency than usual was selected, and although marks will occur if heavy weights are left on it for some time, yet when these weights are removed the marks gradually work out. This floor does not crack or break if anything is dropped on it, as in the case of cement; it is also very much easier for walking or working on, is waterproof and easily kept clean and free from dust. The crane runway on the midway runs the full length of the plant and far enough in front of the steel car shop to load and unload material from the first two material tracks running through the storage space. The storage space in front of the shop is arranged so that should it be found advisable to extend the shop in order to afford a cover for the material, to provide for additional machine room or for any other purpose, the crane runway might be transferred to the opposite side of the midway and still be used for the storage of material.

Supply tracks run east and west through the storage space at intervals suited to the arrangement of the machines inside and to the storage of the material outside. Through tracks for the handling of freight cars under load are located at the north of the bay for passenger car material and at the south for material for freight cars. The material is unloaded direct from the cars to the proper piling space, conveniently located with relation to the supply tracks. With this arrangement the material handling is reduced to a minimum and the supply to the shops is for the most part independent of the overhead traveling cranes, which are used principally for unloading cars and handling large quantities of specially heavy material.

In the front portion of the steel shop are two long bays 100 ft. wide. The first bay is 209 ft. 6 in., and the second 182 ft. in length, one bay being longer than the other in order to allow for unloading directly into the shop any material which it is necessary to keep under cover. The arrangement of the two long bays with traveling cranes running crosswise to the tracks in the shop was particularly suited to the spacing tables and types of machines installed. The crane in the front section is used to supply the material to the machines, through which it is carried automatically into the next bay, where the second crane distributes it from the machines to the various points in the shop requiring it. An effort was made in the lay-out of the shop to use machines with a relatively small capacity, but sufficient in number to prevent the expense and delay of changing dies and setting up, and avoid the big accumulation of ma-

THE UPPER DIAGRAM SHOWS THE STEEL SHOP (FREIGHT CAR SIDE), LAYOUT AND THE LOWER DIAGRAM THE GENERAL PLAN OF THE C.P.R. ANGUS SHOPS, MONTREAL.

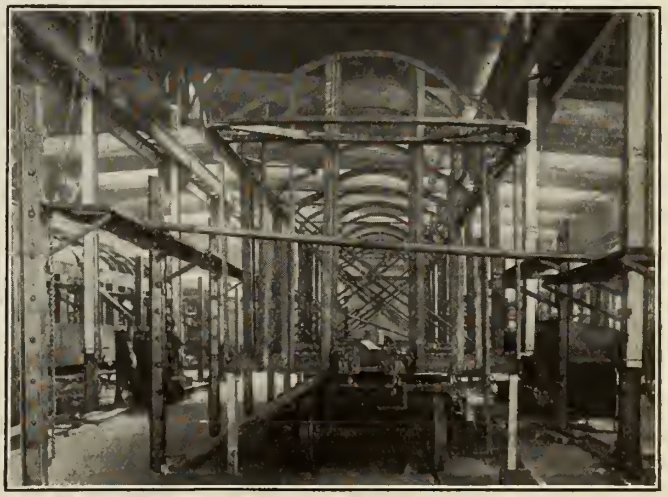
terial necessary to feed the shop without delay when one large machine is used for several purposes.



In the freight shop four spacing punches are used. One of these is fitted specially for punching 6-inch Z-bars for steel centre sills for repairs on the line, and is not concerned in any way with the steel car work. This machine is fed by an independent lorry track. The Z-bars require to be punched twice, once for the flanges and once for the webs. The material is run in beyond the punch and is handled through it to the front of the shop. Specially arranged air jacks are used for lifting the Z-bars to place on the rollers which feed the machine, and also for unloading the punched Z-bars from the machine.. Skids are so arranged that the Z-bars are lifted and skidded off the machine without being touched by hand in any way. It has been found cheaper and quicker to run a quantity of bars through one operation, and when a considerable number have been punched, to move them back for the second operation, which of course requires a change in the set-up of the machine. On the last operation, instead of unloading to the material space at the side of the machine, the Z-bars are skidded in the opposite direction on to the rails, where they are required for assembling for draft gear, etc. From these skids they are slid on to the trucks which take them to the front of the shop where the couplers and draft gear are fitted. They are then either loaded direct to cars for shipment on the line or used in the freight car shop where heavy repairs to existing equipment are made. The second spacing punch is used for the side plate of the car (a 4-inch Z), and floor stringers, which are 3 in. Z. The capacity of this machine is well above present requirements.

One spacing table is used for punching the webs of channels (centre sills 15-inch and side sills 8-inch), while another machine punches the flanges of these same channels. The machine which punches the webs of the channels does the work in one operation and has, therefore, double the capacity of the flange machine. With the present output of the shop, the web punching machine works as above for only one-half of the time, the balance of the time being used on cover plates and similar flat work. An additional punch for the flanges has been installed and the foundations for the spacing table laid out so that without disarranging the handling of the material, by adding a spacing table to the existing punch, it will be possible to double the output of these machines. This spare punch is used for hand work at the present time. With the provision of the spacing table on this coping punch and an extra coping punch, practically no other additions would be necessary to run the machine capacity of the shop up to twenty-five cars per day.

In the event of a breakdown of any of the punches employed on this spacing table work, serious delay to the output could not possibly be avoided. As additional heavy punches of coping, slotting, etc., were necessary, it was arranged to purchase machines which are duplicates of those used on the spacing tables. If at the present time any one of

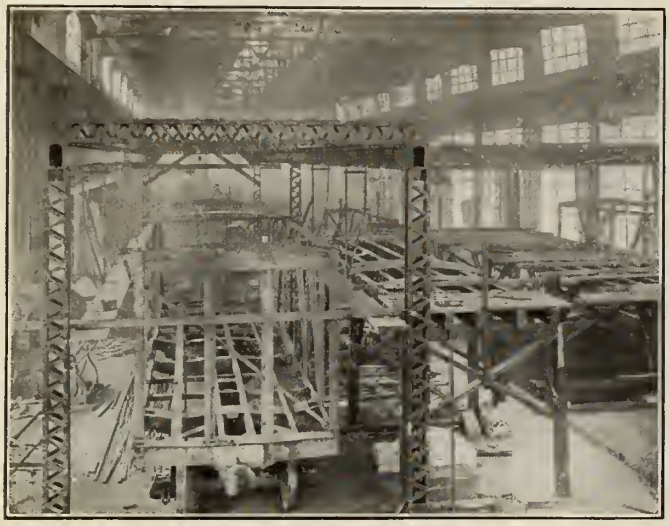


ASSEMBLING FRAME FOR STEEL PASSENGER CAR WORK, SHOWING THE CRANE RUNWAY

GENERAL VIEW OF MACHINE SECTION SHOWING SPACING TABLES IN FOREGROUND.

STEEL PASSENGER CAR SHOP FROM BACK OF HEAVY PLATE SHEAR.

FIRST POSITION IN PASSENGER CAR ERECTING SHOP SHOWING ARRANGEMENT OF SCAFFOLD POSTS.



the punches on the spacing tables should become totally disabled, it would be possible to substitute another punch or part of a punch with short delay and keep the shop running, as in the case of punches for coping and similar work, substitutions could readily be made. On all the machines used in the shops the interchange of punches, gags and other jigs have been closely considered to prevent delay, or the necessity of large stocks being carried.

The piling space outside is arranged so that the material can be skidded on to the lorries by hand and taken to the spacing punches and other punches by hand, which in case of trouble with the overhead crane saves a great deal of time. Care was taken in the case of the heavy material, such as the centre and side sills, to arrange that each movement should be short and easily handled. The first movement from the pile is to the web punching machine, from which the sills are handled by small cranes and rollers to the flange punching machine, without any backward movement. On the flange punching machine, the sills are bolted together in pairs, run through the machine, brought back through the machine, turned over and handled through a second time to punch the lower flanges.

The design of the spacing tables is particularly convenient as each of the templates has two lines of gauge points and, therefore, the punching of both pairs of flanges is done on a sill from the same template. From the last movement on the flange punching machine, the material is unloaded on to the floor, where a very large space has been reserved to allow of a considerable accumulation of finished centre and side sills, to prevent the possibility of delay on these very important items. The small track on which the finished Z-bar centre sills are taken out of the shop is also used to supply the Z-bar sections to the small spacing machines. This double lorry track arrangement prevents the crowding which would be inevitable if all the material were handled over one supply track.

The centre sills when punched on the webs and flanges also require to have slots punched in them to accommodate the draft gear and brake pipe. These slots are made on a coping punch so arranged as to require no backward movement of the material. This die is left set up on the machine all the time, but is so arranged that small dies can be set up beside the large ones to enable the machine to be used for light punching when not punching slots. One other coping punch is fitted up with dies for making the various mitered cuts and coping the side posts and braces. The coping punch beside the Z-bar machine is fitted with a special die for coping the side plate. Three high-speed punches are used for all the various small punching work around the shop, with the exception of the diaphragms which are punched on a horizontal punch. This completes the machine equipment for the steel shop, but it must, of course, be borne in mind that the hot forging, upsetting and bending work are done in the blacksmith shop and material is brought into the steel shop already finished.

Special attention has been given to

ERECTING FRAME FOR STEEL FREIGHT CARS, SHOWING METHOD OF STORING AND APPLYING CARLINS.

the handling of material to make this, as far as possible, independent of the overhead cranes except for the movement of large quantities of heavy pieces. For this reason the shop is particularly well equipped with air jacks, skids, overhead fixed hoists, traveling hoists on runways and swinging jib cranes. To reduce the labor and the cost of handling and of repairing, ball bearings and roller bearings are used throughout on jibs, hoists, hand traveling cranes and material rollers. Special care has been taken to have definite room allowed for the piling of material outside the shop, for the storage of material around the various machines and the storage and accommodation of the finished material. Specially constructed racks are used throughout the shop. To maintain the orderly handling of the material, painted lines are used to define the boundaries of these piles and mark the passage ways, which are always kept clean of material. These boundary lines are repainted at the end of each week, at which time an absolute clean up is made of any material which would otherwise tend to accumulate.

Punching Equipment.

The Thomas spacing tables are of the semi-automatic type. The movement of the carriage is controlled automatically, while that of the gags for bringing one or more punches into play at each stroke is controlled by hand. The tables are electrically operated, their movement being controlled by two templates 7/8 in x 3 in., having a double row of steel pins. They are so arranged that when the trip on the moving portion of the table engages the pin it automatically stops and locks the material to be punched and at the same time, by means of an electric magnet, operates the clutch on the punch. The punch head, after coming down and punching the material, on its return stroke disengages the carriage and the clutch on the punch and automatically starts the movement of the material. The operation is repeated as each successive pin is encountered. The particular value of this type of machine is that templates may be made up of wooden strips with pins driven in at very short notice and small cost, while permanent steel strips with inserted pins can be made up for permanent work. The strips can be changed in a few moments and are kept at hand for the various classes of material to be handled. The accuracy of the work practically depends upon the accuracy of the template, and the results obtained are extremely satisfactory.

High-Speed Punches.

The high speed punches were designed specially for this shop by John Bertram & Sons. They run at the high speed of 60 strokes per minute and are entirely without gears, being belted from the motor direct to the flywheel of the punch. The clutch is of the six point type. Two punches are fitted in each head, both being controlled by a single gag lever which has three positions, one for each punch and a neutral position. These high-speed punches are not equipped with spacing tables, as it was found that on account of the slower movement of the carriage on the spacing table and the consequent time lost in entering the piece, hand punching for small light pieces was cheaper, providing the same could be made sufficiently accurate. To do the punching more accurately, the method adopted was that of using a drilled or punched template and of butting the piece against a gauge inserted in each successive hole in the template.

The usual method is to make up a square template at one side of the machine, having one or more rows of holes punched in it on each of the four sides, some having as many as eight different rows of holes, each row being used as a template. The material is moved along the top of the gauge until it butts against a pin inserted in each hole in turn. It is found that for certain classes of work the gag is thrown in on the punch and the operator can move the material fast enough to catch every hole with the punch running at 60 strokes a minute. This is nearly three times as fast as the rate at which it would be punched on a spacing punch, and the time of setting up and the backward movement of the carriage is saved. While only one piece is handled at a time, the cost of punching light, short material per hole is fully as cheap as when done on the spacing punches.

On some of the punches, where there is little variation in the work handled, single sided templates are used with three or four rows of holes, which take care of the work satisfactorily. No marked-off work of any kind is used in the shop, except for irregular pieces, which cannot be punched in the spacing punches or by the method described here; and most of the other work is punched to a gauge where it is possible to design one. This not only reduces the time in punching and saves the expense of marking off, but greatly increases the accuracy of the work done.

Assembling.

Special arrangements were made for the storing and handling of material in relation to the assembling to reduce the labor to a minimum. With underframes an important gain was made by the use of clamps instead of assembling bolts, the common practice elsewhere. For an assembling bolt, it is necessary to get a full hole before the bolt can be applied; a wrench is also required, and the time spent in this way is greatly reduced by using a clamp with a hinged handle. The clamp is applied between the holes to be reamed, and the time lost in removing the bolt from one hole and applying it in the adjacent hole when reaming is entirely avoided. The clamps are applied by the men assembling. They are not touched by the men reaming, but are removed by the riveters as they work up to the clamps. They are collected from the floor by a laborer and carried back to the assembling position for the next succeeding frame.

STORAGE SECTION IN FRONT OF STEEL CAR SHOP.

In assembling the underframe, a jig is used which accurately locates the centre sills, bolsters and cross bearers. By this method the sills are assembled square, reamed in the same position and then transferred to the underframe riveting jig. This jig consists of a number of cast columns supported on I-beams bolted on a concrete foundation and securely holds the underframe in position while being riveted, so that the

underframe is constructed accurately and square in every way. A great deal of time is thus saved in the assembling and the line of the car when finished is very greatly improved.

To rivet the underframe on the jig by compression riveters without turning it over, it was necessary to have a special type of riveter designed with a thin nose to permit the top row of rivets to be driven and to allow sufficient clearance for the bottom row, particularly on the bolsters, to be driven without moving the underframe. The makers considered that this would be an expensive type of riveter to maintain, but quite the reverse is the case. It is not possible to use a high-speed steel snap for ordinary work, as it is extremely liable to break, but when it is inserted in the cast steel block it is well supported and does not fracture. It is much denser than any other material that could be used. When renewed, the amount of steel is so small that the cost is not considerable, and it has easily proved to be the cheapest type of die, for maintenance, of any compression riveter in the shops.

The movement of the steel sills from the point of assembling to the jig where they are riveted together is handled entirely by small air jacks on trucks running on narrow gauge rails which move the underframe from position to position without requiring the use of the overhead crane. This, of course, saves a considerable amount of time and enables the movements to occur simultaneously, which could not possibly be done if it were necessary for the crane to move them all, as the crane can only handle one at a time. The value of the time thus saved is considerable and easily appreciated. The only portion of this output which is fixed is that of riveting the underframe with the compression riveters, and the capacity is about fourteen or fifteen cars per day. Provision, is, therefore, made for the installation of an additional position for riveting the underframe along the side wall of the building where the jib cranes for handling compression riveters can easily be located. The other positions can easily handle twenty-five cars a day, by the addition of more help where required.

Side Frame Jig.

For assembling the side frame, a jig was designed by which a considerable improvement has been attained over former practice. The side frames for as many cars as are required are built on one jig, all the parts being placed in templates, giving them a fixed location. The riveting on the lower side sill is handled by two suspended compression riveters, the balance of the riveting being done by hand. The parts are at present clamped together by hand clamps, which will shortly be replaced by fixed pneumatic clamps in order to hold them more rigidly and avoid the time lost in applying and removing the hand clamps. Special attention has been paid to the loss of time in locating and applying clamps, and pockets are arranged in the frame so that everything is as close as possible to the point where it is to be used. Even more care is taken in the racks for the material, as each post and brace is piled directly opposite to where it will be used in the frame. A small gantry crane is being constructed to handle this material from the jig to the piling space, so that no time whatever will be lost waiting for the traveling crane.

The same arrangement is made for the end frames as for the side frames, a small traveling crane being used to handle the finished end frames from the assembling sections to the place where they are piled.

Erecting.

The erecting is commenced at a point where the trucks are brought in from the supply tracks at the side of the shop and handled across turntables into proper position. The underframe is then brought down by the traveling crane and placed on the trucks. In the first position, the floor stringers are riveted in place and one end frame is lifted on by a jib crane specially constructed for that purpose. When this is done, the underframe is moved down to the second position, and the side frames are lifted up by two special hoists from the convenient piles where they have been placed by the overhead crane, and the other end frame is lifted to place by a jib crane. In the third position, the carlins and the riveting up on top of the car is completed on an overhead scaffolding which allows the men to work conveniently. There is also an upper floor and special racks for the accommodation of the carlins and other material.

An all metal roof designed by the Canadian Pacific Railway for these cars required special handling. The usual practice was to allow the cars to go out of the shop with the carlins riveted in place, and the roof sheets and various wooden parts of the roof were applied in the wood freight car shop. This roof being all steel with outside carlins, it was necessary to apply the roof sheets before the carlins, and therefore the roof was assembled and erected complete on the cars in the steel car shop in two positions and the cars turned out of the steel shop with the roofs complete in every respect except for the application of the wooden running boards. This is a very unusual feature and the fact that the entire output of the steel shop could be handled in this way is evidence of how readily the roof and carlins are applied. A cut shows the arrangement of upper scaffold platforms which were used for the application of the carlins of the ordinary roofs and for the convenient storage of carlins and roof sheets for the all steel radial roof.

Room for a fifth erecting position is allowed, but this is not required with the present output of the shop. The cars are moved outside by a motor driven car-pull situated in the lower end of the shop, being sent over to the wood shop for lining, roofing and painting, and are then reported for service.

Steel Passenger Car Shop.

The method of handling material in the passenger shop is the same as for the steel freight shop. The arrangement of the machines is similar, except that it is not possible to get enough work of the same class with the relatively small output to use spacing tables to advantage. A coping punch is, therefore, fitted up with rollers for the convenient handling of long material, and the work is punched to gauge much in the same way as on the smaller punches, although considerable marked-off work has been used up to the present.

The operation of the high-speed and other coping punches is also similar to those used in the freight shop. The additional machines comprise plate straightening rolls for straightening or bending plates, and a plate edge planer for the outside sheets for the coaches. A cold saw and metal band saw are used for cutting accurately such material as would not be handled to advantage in the shears. A large gate shear, double angle shear, combination horizontal punch and bending or straightening machine completes the ordinary machine equipment in the passenger shop.

As it has been decided to drill the side plates instead of punching them, a special drilling machine was installed for this work. This is of similar construction to a locomotive frame slotting machine, the plates being laid out on a long table and a traveling head provided, fitted with a number of electric drills. The head, of course, is very light in order to make it easy to handle. Templates with hardened steel bushes for drilling are used as in ordinary good practice.. By laying several sheets one on top of another and drilling a number of holes at the same time, the drilling costs are reduced to a minimum and compare very closely with the cost of punching in an automatic machine besides being necessarily much more accurate, and the drilling does not buckle or distort the sheets or leave a rag on the lower edge as in punching. This is very important for the side sheets on

(Continued on page 483.)

Safety Provisions Relative to Transmission Machinery--III

By W. Sydney Smith

An official report by the Inspector for Dangerous Trades in England, regarding fencing and safety precautions for transmission machinery, has been issued. It explains the structural and administrative safeguards with regard to the several parts of transmission machinery which experience shows to be needed for the protection of persons employed.

OVERHEAD pulleys within reach of the workers should be fenced underneath, Fig. 11, with strong guards of metal or wood, which should be extended to protect the low-lying portions of horizontal and oblique driving bands in order to prevent accidental contact with moving parts, and especially at the intake between belt and pulley, which is the most dangerous part. Accidents are often due to contact with the spokes of pulleys and wheels in motion. Hence the sides of spoked pulleys within reach of workers, or to which they may have access, should either be fenced or the spokes filled in with circular disks to convert them into plate wheels. The sides of all drums in the grinding rooms of tenement factories are required to be closely fenced, and the need is the same wherever spoked pulleys are accessible to the workers.

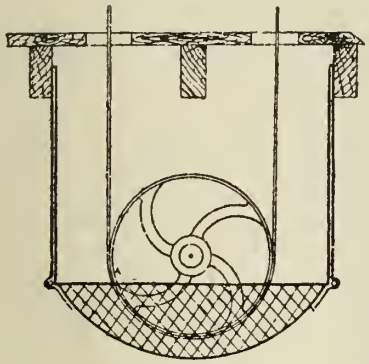

FIG. 11. HINGED WIRE NETTING GUARD FOR OVERHEAD BELT AND PULLEY.

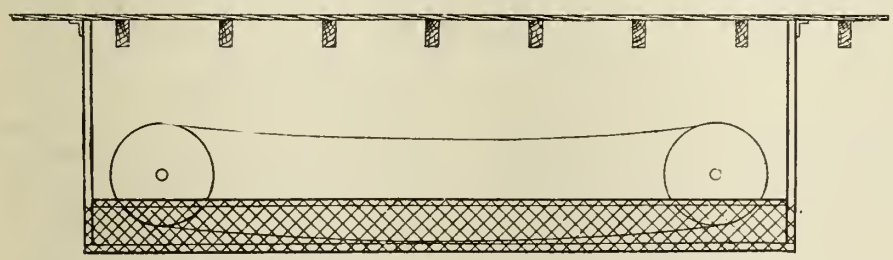

FIG. 12. EXPANDED METAL GUA RD FOR OVERHEAD BELT.

Belts, Ropes and Chains.

As regards the fencing of belts, the conditions are materially different from those of shafts and pulleys. Heavy overhead belts which may never be approached whilst in motion, and are to that extent safe by position, often require to be protected underneath as a safeguard in case of breakage; further, the fencing of the low belts driving the individual machines, e.g., looms, lathes, and other machine tools, is in many cases impracticable, and though such belts are strictly mill gearing, little danger arises where metal fastenings are avoided and efficient strap forks are provided.

Periodical examination of belts would lessen the number of breakages. Belt accidents would also be reduced by prohibiting the use of projecting metal fasteners, or by requiring all belts with such fastenings to be fenced. There is, however, always risk of accident arising from contact at the intake between belt and pulley or contact with running belts, and fencing is necessary in the following circumstances:—

(1)—All vertical and oblique belts (irrespective of size and speed) passing through floors should be fenced around the openings to a height of at least 4 ft. Where the belts are oblique, it may also be necessary to fence the underside of the belt to a height of at least 6½ ft., so as to prevent accidental contact.

(2)—Horizontal and oblique belts used for main driving and counter-driving within 6½ ft. of the floor or other place to which the workers have access while the transmission machinery is in motion, should be securely fenced by rails or casings so as to prevent accidental contact.

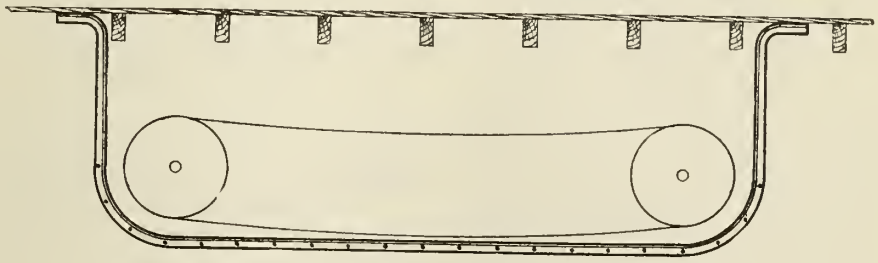

FIG. 13. LADDER TYPE GUARD FOR OVERHEAD BELT.

(3)—All overhead main driving belts, if more than 4 in. wide and moving with a velocity of more than 30 ft. per second, should be protected underneath with strong guards of wood or metal at those parts where persons are liable to pass under them.

The protection under heavy overhead belts must be substantial, e.g., troughs of wood, sheet metal, perforated or expanded metal, strongly constructed and firmly supported by the walls or beams, (Fig. 12). Ladder-like guards made of angle irons fitted with metal rungs (Fig. 13) or strong bow-shaped iron cleats fixed at intervals (Fig. 14) are also efficient; the latter types will not interfere with the examination of the belt or of a rope and have the advantage that the driving bands or ropes are always visible.

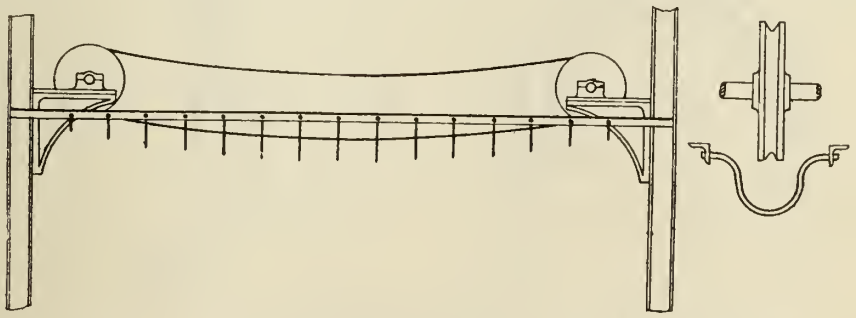

FIG. 14. BOW-SHAPED IRON CLEA T GUARD FOR OVERHEAD ROPE.

Fencing of other driving-belts, in addition to main-driving and counter-driving belts may be necessary according to position, size, speed or special circumstances, but much judgment and experience are necessary. Low belts near the floor level and high-speed belts should in general be guarded, but each individual case must be considered on its merits as to the degree of danger and the nature of the fencing requisite under the circumstances. Many belt fasteners are dangerous on account of metal projections, but of metal fasteners those consisting of a continuons wire stitching held together by a peg other than a metal peg, are safe.

The fencing of driving ropes, except overhead ropes, should generally be on the same lines as the fencing of belts. There is not the same need for fencing small overhead driving ropes, as ropes never break without showing signs of wear and giving ample warning before breakage by the production of quantities of fluff, unlike belts which generally break unexpectedly.

Driving chains of metal, on account of their weight, are more dangerous than belts or ropes; the intake between a driving chain and pulley being as dangerous as the intake of toothed gearing. Chain belts should at least have a strong trough underneath, whatever their position, and if accessible they should be enclosed.

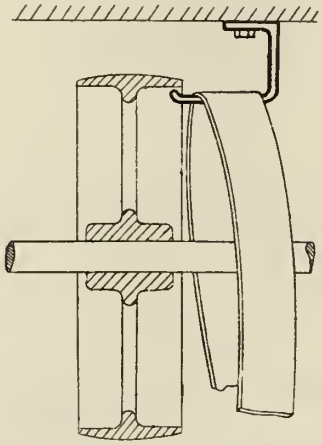

FIG. 15. SIMPLE BELT PERCH.

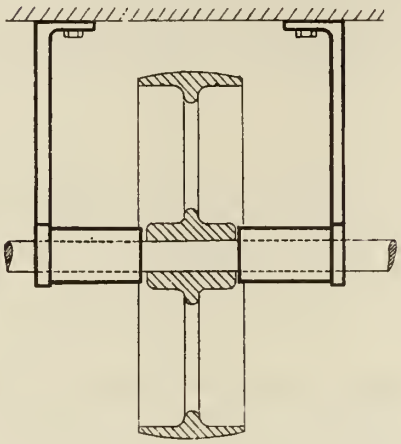

FIG. 16. SLEEVE BELT PERCH.

Belt-Perches.

Belt-perches are closely associated with the fencing of belts. Where machines are worked intermittently, it is a common practice in many factories. after the use of a machine, to throw the driving belt off the shaft pulley until the machine is again required, in order to economize power and to save wear and tear of the belt and pulleys. A belt may also slip off the driving pulley accidentally, or may be thrown off intentionally for the purpose of repairs. It is a dangerous practice, however, to allow a belt under such circumstances to rest on a revolving shaft, owing to the liability of the shaft to seize the belt and wind it up. Accidents, due to falls of shafting and parts of the machinery, have often occurred from such a cause. Many fatalities and serious accidents have also happened to persons on taking hold of a belt resting loosely on a revolving shaft, they having been suddenly carried up to the shafting owing to increase of frictional resistance between the belt and the shaft.

Provision must be made in all cases to keep loose belts out of contact with revolving shafts. There is no danger if the shaft is fenced by a sleeve of metal or other material. In other cases some type of belt-hook or belt-perch must be used, and various forms are available. The simplest (Fig. 15) consists of a strong hook fixed adjacent to the driving pulley, with the horizontal portion somewhat longer than the width of the belt and the end turned up under the pulley rim. Another type, consisting of a sheet-iron sleeve or trough riveted to a bracket, is shown in Fig. 16.

A belt-perch may be fixed on each side of a pulley if it be desired to displace the belt on either side. For horizontal belts, the perch may consist of a simple bracket provided with two pegs as in Fig. 17, fixed near the driving pulley and shaft; while similar brackets may be fixed at intervals to support a long stretch of horizontal displaced belting.

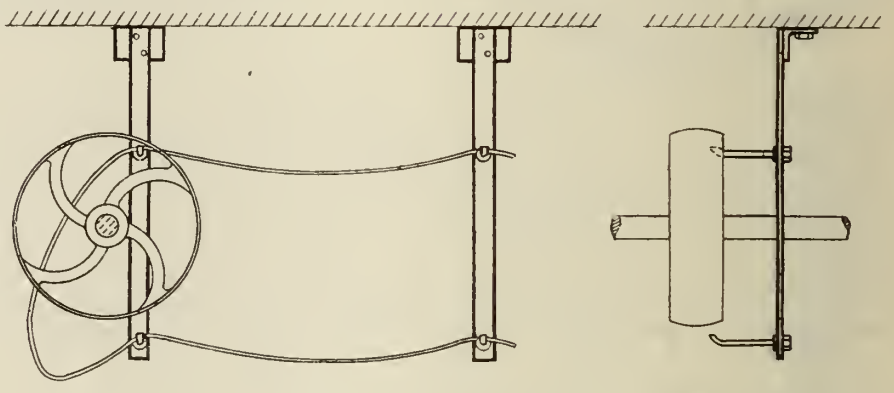

FIG. 17. BELT PERCH FOR HORIZONTAL BELTS.

A better type, where belt-poles are used to replace belts, is shown in Fig. 18. This consists of four or more parallel pegs with turned-up ends, bolted to a curved bracket fixed eccentrically near the pulley. T'

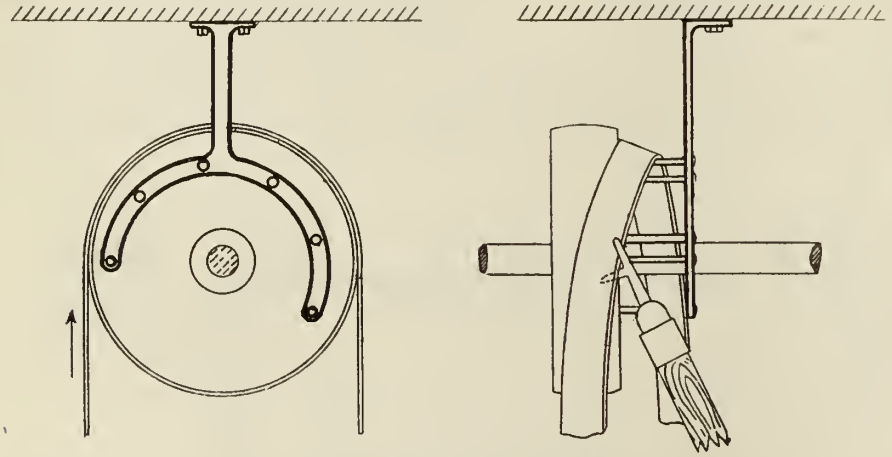

FIG. 18. IMPROVED BELT PERCH.

Dominion Steel Output.—The following are the figures of production by the Dominion Steel Co. and Dominion Coal Co. for the month of April:—Pig iron, 20,971; steel ingots, 26,444; rails, 14,601; rods, 3,021; bars, 2,238; other products, 4,258. These figures are approximately 60 per cent. of last year's output. The coal mined for the month is 408,931, against 437,133 in 1913.

SYSTEMATIC BUSINESS MANAGEMENT

Practical Articles for Managers, Superintendents, and Foremen, to Assist in Carrying on the Business Economically and Efficiently.

INDUSTRIAL LIFE CALLS FOR TRAINING.

DOES not formal education as organized and controlled by the State stop short for a very large proportion of the youth at too early a period? Should the State organize and support vocational education? If so, what form should such education take?

These were the questions Dr. F. W. Merchant, M.A., sought to answer in his address before the College and High School Department of the O. E. A. recently.

The first question was proposed, the speaker said, because it was taken for granted that every child in the Province was receiving a fair common school education, and that for the great body of the people such an education was sufficient. While a few may be given a high school course, and a still smaller number be provided with university or professional training, the speaker questioned whether the duty of the State towards the child was not regarded as ceasing with making provision for a public school education.

Training That is Absent.

There can never be a permanent system of technical education which is not built on the solid foundation of a thorough elementary training. Managers of leading industries through the Province declare that a better elementary English and mathematical education is required. A large proportion of those entering industries are receiving no instruction in either theoretical or practical departments of their trades in State-supported schools.

Specialization in manufacture has made it almost impossible for a youth to acquire the elements of a trade in a shop or factory. There are at the present time no adequately organized agencies to give the youth a training in trade or in the elements of technology. Labor and capital are agreed upon the need of such a training.

Modern life has not yet accommodated itself to the great revolution of our industrial system. We believe that the education of workers is a public necessity, and that it should not be a private but a public function, conducted by the public, and the expense involved at public cost.

With regard to plans for such a training the speaker was of the opinion that every public school should be a pre-vocational school in the sense that pupils will find in it opportunities for discovering their aptitudes and will receive through it such a grounding in the elements of a general education that they will be in a position to take fuller advantage of a later course in more direct preparation for their vocations.

The speaker described the technical system as it works in European countries, where in a good many instances there was compulsory training. This he declared to be necessary to introduce into the country.

RELATION OF EMPLOYERS TO TECHNICAL AND INDUSTRIAL EDUCATION.

EVERYONE who has studied the subject, said Henry V. Gunmere, at a recent conference, knows the intimate relation between the industrial standing of any country and the knowledge and the efficiency of those engaged in its industries. While this relation holds for all, from the humblest unskilled operative up to the corporation manager, it seems especially important to have those in the lower places realize it, since their educational opportunities are certain to have been the more limited.

Thousands of boys leave school yearly from the lower grades to go to work. To most of these will come later a keen realization of lost opportunities and the absolute necessity of making up for them, for they enter commercial or industrial occupations utterly unfitted for advancement to higher positions. What they can do, how well their capabilities can be developed, will in most cases depend on what possibilities their employer brings to their attention and makes available. Most employers are well aware of this and try to help those who work for them to find ways of gaining the knowledge they need. Experience has shown that as a purely business proposition this pays. A young fellow whose character and habits of life are known, whose personality and ability have been tried out, is usually much to be preferred to any stranger when appointments are made to positions of large responsibility.

Educational Problems to be Studied.

The scope of this article does not permit more than a passing word regarding the various educational agencies which have been made use of for the purpose of training men for advancement. Its main purpose is to point out some of the many educational problems which must be studied in order to decide upon the best plan of procedure in any given case.

Associations or clubs, whether local or branches of a national body, which meet periodically to hear an address or participate in a discussion are at best educational only in a supplementary way. Any study done in connection with them is not consecutive and usually to be beneficial needs a foundation which is too often lacking. The corporation school is rather new, and for every corporation large enough to organize and conduct one, has interesting possibilities; the tendency, however, is always to train for immediate usefulness in detail rather than in broad principles, while the variety of courses which can be offered is bound to be small. If, for example, the school is organized to benefit the workers in the shop, what shall be done with those in the business office who need an entirely different training?

A correspondence school, either within the corporation or outside its control, offers the only means of systematic study for those residing at considerable distance from the large centres of population, or where the number of persons interested in a given kind of work is too few to warrant the formation of a regular class. When schools can be reached where experienced teachers are in charge, where direct recitation methods are used, and where a variety of courses can be offered in a systematic way, the establishment of regular classes in off-duty hours offers the best method of giving the desired instruction. These usually take the form of night schools or evening classes.

Night schools have flourished in the last twenty years wherever established. Their advantages are fully recognized by those who have been attending them. Such are:—Immediate help over difficulties, procured by having an instructor at hand; the opportunity to learn by the mistakes of others in the class; compulsory regularity in study, so important even to a very earnest student; the stimulus of numbers; the desire to stand well in his class; the possibility of drill; and many others.

Such school work, offered not only in the evening, but in the late afternoon as well is likely to have a remarkable growth in the future. To the general public the work which is being done as regards both scope and quality remains

practically an unknown quantity at the present time. Employers are just waking up to what has been and can be done in this way. No matter what educational agency is used, a number of problems arise which can be solved only by the co-operation of employers, employees, and teachers.

What courses are needed? How much time can be required of busy men for school work? What fees are suitable? How shall those be accommodated who have long distances to travel and high carfares to pay? Should classes be established in locations remote from the schools, in shops or in offices, but under the control of their trained faculties? These are some of the problems which have never been fully answered. The answers would probably differ with a change in locality.

Other questions are almost wholly the concern of the employer; such as—What school and what kind of education can best help my employees to gain what I want them to know? Which of them can profit most by systematic school work? How can I help them to get it?

The only satisfactory way to reach a conclusion on these matters is to have some common meeting ground for all interests where free discussion can have full play. In Philadelphia steps to this end have already been taken. Last spring representatives of the Central Educational Institute of the Y.M.C.A., Drexel Institute, the Franklin Institute, School of Industrial Arts, Spring Garden Institute, Temple University, and the Wagner Free Institute of Science joined with representatives of the Philadelphia Trade Schools, and the Philadelphia and Camden Public Schools in arranging meetings for the purpose of becoming acquainted with one another's work and the educational problems employers have to face.

Wishing to avail themselves of the wide resources of the Public Education Association of Philadelphia, members of the faculties of the participating institutions are now organizing a section of that association to be known as the Industrial and Technical Education Conference of the Public Education Association. The membership is to consist of educators and employers, and the purpose is to seek earnestly the solution of the problems arising from the needs of the vast numbers of young people who have never had proper opportunities for securing that knowledge which will pave the way to better service and higher responsibilities.

It is hoped that the movement thus started will spread to include not only local representatives, but all those employers whose employees find in the large city opportunities which cannot be offered nearer. This means extending the work to a great many miles from Philadelphia, for classes could easily be arranged outside the city, managed by experienced teachers who are specialists in any given line of instruction.

SELF-ASSERTION.

By J. E. Cooley.

ARE you one of those who believe that the day of getting a foothold, prospering unaided and alone by one's own individual efforts, has passed away? Are you one of those who believe the day of making millionaires is no longer possible? Are you one of those who think opportunity knocks but once on the outside of each man's gate, and then throws him down for the rest of his days?

Opportunity, wealth, the power to rise and win, are to-day within the reach and grasp of every breathing human individual. It will ever be so upon this rolling, bowling planet. It is in the power of every human being to become great—to become wealthy—to fill the years with usefulness, and leave behind them vast areas of constructive works; peopled with living, breathing, hustling, human souls.

Do you know what keeps this great ball—7,913 miles in diameter, 24,859 miles in circumference—in motion? Do you know what causes the sun to shine and send its rays, 91,430,220 miles in length, down to us?

It's force—universal force. Vesuvius eruptions are belched forth by it. Earth's oceans' caverns were dug by its unrelenting power. Youve got it in your little finger, in your biceps, in your spinal cord, in the base of your brain; it runs the power plant of your anatomy. It's the great energizing fluid that carries men over the brink of destruction or upward to the heights of fame.

Do you want to rise? Do you want to go forward where others dare not climb? Do you want to find other worlds to conquer—be a man above men—have your name go ringing across the ages; a name that will outlast tombs and tablets of bronze. Then be a doer, a mover, a constructor. Lead, don't follow. Summon all the strength within. Go forth and take your rightful place in the universe; be a constructor, be a changer, be an improver. Count the things around you that need changing, count the things that need improving, count the things that should be cast aside, and have new things installed in their places, and be the one to change, improve and install.

Bring out of yourself each day all the force you can squeeze from bone and sinew; from cord and ligament, and put that force into active, progressive service; the service that builds more factories, enlarges plants, erects more smoke-stacks, that counts at each stroke of the clock from sunrise to sunset; service that makes better the condition of your fellow-men.

Would you abolish disease, poverty and crime? Would you build cities, with paved streets and healthy sanitary homes—within them glowing firesides surrounded by happy smiling faces? Fellow-man, that is in your power. It is in your power to recreate yourself, to become energized, and build greater than ever man built before.

For millions of years this universal force has been calling to mankind to build and make better the conditions on this earth. It has been calling, with the noise of whirling planets, of earth's eruptions and crashing glaciers. It is asking you, sir, to do to-day the things it asked of old. It is saying not until you do them will you be crowned with "immortal glory" and clad in "raiment of light." The things that it wants done are the things at hand. Wherever you find yourself, the universe placed you there; and right at hand where it placed you it has placed the things it wants done, and **it expects you to do them.**

CANADA'S TRADE WITH GERMANY.

CANADA'S increasing trade with Germany and the desirability of having that country as a Canadian customer are pointed out in an article in the Weekly Report of recent issue by Mr. G. F. Just, the Canadian Trade Commissioner at Hamburg. Canada is now in the unique position, says the article, of exporting more to Germany than she is importing from that country. The exports of wheat to Germany during 1913 were 50,000 tons above those of 1912, which were two and a half times as much as in 1911.

Again, this year it is expected that Canada will have exported more than was imported from the German Empire. Canadian wheat, barley, and oats enter Germany at the same rate of duty as do the same products from other countries, but in agricultural products, of which Germany imports large quantities, all competing countries enjoy a lower tariff than is afforded Canada. Conspicuous among these is flax, of which Germany imports $42,000,000 worth, chiefly from the Argentine Republic.

The Canadian Minister of Agriculture has decided to reorganize the Dairy and Cold Storage Department, separating from same the fruit section and creating a new Fruit Division. Daniel Johnson, of Forest, Ont., has been appointed fruit commissioner. J. A. Ruddick will continue in charge of the Dairy and Cold Storage Division.

A DRAFTING ROOM SYSTEM.

By D. O. Barrett.

THE writer at one time had charge of the drafting room of a firm building gas and gasoline engines and their accessories. This firm manufactured a variety of sizes and employed about 225 men. The original system of filing drawings had been a separate drawer devoted to each size of engine, and the consequence was that the filing cabinets occupied most of the space in the drafting room, and when a blue print was to be located it was necessary to sort over a confused jumble of tracings and prints of all sizes, the drawers, of course, being made large enough to accommodate the largest tracings. This system caused so much confusion and loss of time that the following method was adopted.

The bottoms of five of the drawers in one of the old cabinets were removed

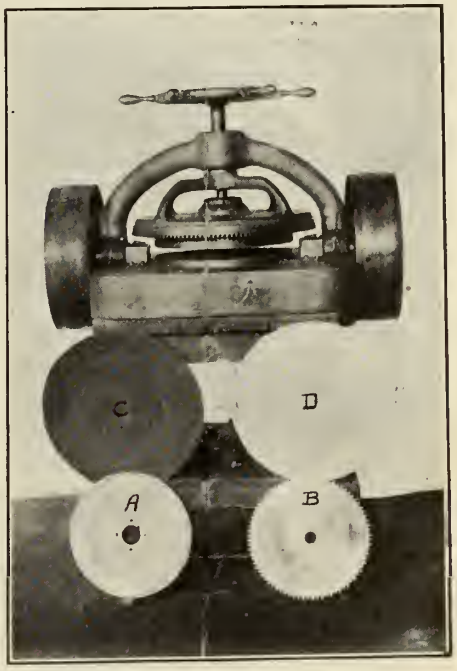
A DRAFTING ROOM SYSTEM.

and six of the frames fastened solidly together, thus making one deep drawer. Partitions were then put in on either side, corresponding to the width of the drawings that were to be used. These partitions were grooved every half-inch with a saw cut, and a piece of 16 gauge sheet metal used as a back; this could easily be slipped along as occasion required.

Standard size drawings were 17 in. by 22 in., or in case of large sizes, some multiple which could easily be folded to this size. Envelopes were now made from the heaviest grade of manila paper, these being about 18 in. by 24 in., being left open at the top, or along the 24 in. dimension. By folding back the open edges about twice, and gluing, these envelopes will resist a great amount of handling without tearing and will last for many months, especially so as it is seldom necessary to remove them from the filing case. A further reinforcement was glued along the bottom, the edge on which they rested. These were fyled vertically, of course, the same as in the card index.

The drawing shows the manner in which the envelopes were made, and the style of title printed on the open edge of each. When these envelopes were placed in the files, the titles came at the back, but the top of the filing drawer was about waist high, so that as the envelopes were pulled forward in sorting over, the titles could be easily read, and were the envelope laid out on a table, the titles remained on top. At the left edge was placed the number of the envelope in the filing case. These envelopes, carrying engine prints were filed first according to sizes of engines, and after them came any other prints. The symbol of the engine was next, and then the horse-power; after this also being placed the bore and stroke of the engine, so that all the information covering the prints in that particular envelope were given on its face.

It was often necessary for the machine shop foreman or his assistant to come into the drafting room and pick out prints themselves so that it was very essential to have the system as simple and practical as possible, and after long-continued use its success was borne out. An index was also provided giving the number of the fyle and the material contained in the envelope, together with its horse-power and symbol, by which they could be easily located.



The original drawings were made on tracing paper, which was much cheaper than tracing cloth, and when handled with a reasonable amount of care would last indefinitely. These drawings were fyled in the office vaults in the same size envelopes as used for the prints. One print from each drawing was always on file in the drafting room, and more in case the prints were often used. Drawings bore the same number and symbols as the parts themselves, so it was easy to locate them after having the part symbol.

PEINING, GRINDING AND POLISHING MACHINE.

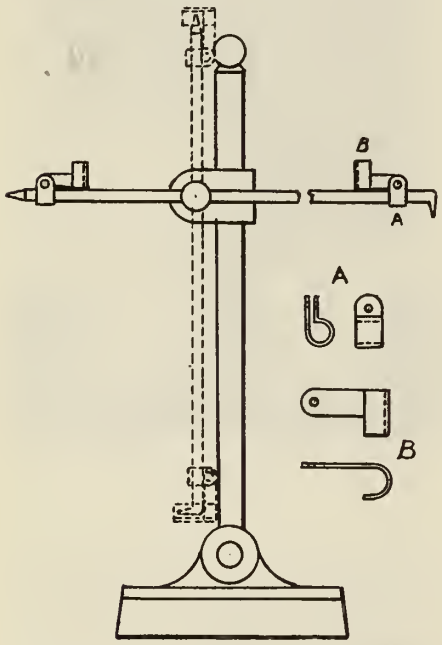
By A. E. S.

THERE is here described an interchangeable peining, grinding and polishing machine designed by Wm. Gibbs, of Brantford, and which is in use at the plant of the Verity Plow Co. of that city. Its purpose is the straightening and polishing of metal disks and the polishing of sheets of any material in widths up to 18 in. and in thicknesses of 4 in. and under.

The machine has a heavy frame and base plate, as shown in the illustration. There are two horizontal revolving disk plates, the lower one being stationary and the upper one adjustable up and down by means of a powerful screw. The drive consists of two pulleys driven from a shaft by means of one straight and one crossed belt. Each pulley has keyed to the same shaft with it a rawhide bevel pinion, which meshes with the gears attached to each disk, giving them a double drive in opposite directions. The top disk can be lifted out of mesh at will, while the bottom one runs continually.

PEINING, GRINDING AND POLISHING MACHINE.

The peining disks consist of flat hardened plates, 18 in. in diameter, and carrying 250 hardened balls, no two of which revolve in the same circle. The pieces to be straightened and polished, such as the seeding machine disk A or the saw disk B are placed upon a spring pin which locates them centrally with the bottom plate. The top plate is screwed down upon it with sufficient pressure to cause the balls rolling on both sides of the disk to work the surfaces of the metal into a condition of uniform tension. The effect is that the disks come out after ten minutes' treatment perfectly flat and straight.



The peining plates can now be removed and grinding plates C substituted. This requires the removal and replacing of two cap screws in each, and takes about ten minutes to accomplish. The machine is speeded up from 18 to 22 for peining to from 200 to 400 r.p.m. for grinding and polishing. The straightened disks are polished in the same way as the peining was done except that but a slight pressure, and ten seconds are required for the operation of finishing both sides.

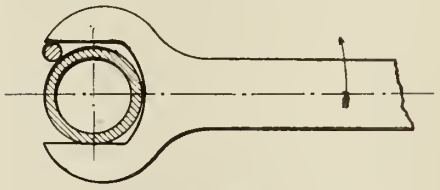
While specially designed for the above purpose, the machine is equally serviceable for sizing and polishing metal and wood sheets of any kind within its capacity, the different thicknesses of stock being accommodated by disks of the requisite thickness to mesh the gears properly. For polishing wood, sanding disks D are used, and the material is fed between the revolving plates in the same way as through a planing machine.

GUARDS FOR A SURFACE-GAUGE SCRATCH.

By James E. Cooley.

WHEN taking from a tool-chest a surface-gauge, carrying it to the work, setting it up and handling it in the several ways necessary in using it, the workman receives a number of "punctures" in his hands from the sharp-

GUARD FOR A SURFACE GAUGE SCRATCH.



pointed scratch contained thereon. These little punctures neglected develop often into other things more serious.

In the accompanying sketch is shown a small guard that when placed on the ends of a "scratch" will prevent the hands from coming into contact with the sharp points, and which cannot be lost off. It consists of a small ring clip (A), made from sheet steel and tempered, and fitting snugly on the scratch. A small arm (B), also made of sheet steel, is fastened on the clip (A) by means of a pin on which it swings to cover the pointed ends. When it is required to use the scratch, the arm (B) can be swung up out of the way; but, when the points are not in use, the arm should be kept down. All pointed instruments should have guards of some kind placed on them.

USEFUL WRENCH KINK.

By G. G. Jackson.

THE sketch shows a simple and effective method of turning a piece of pipe or other round material with an ordinary solid wrench. This is not a new

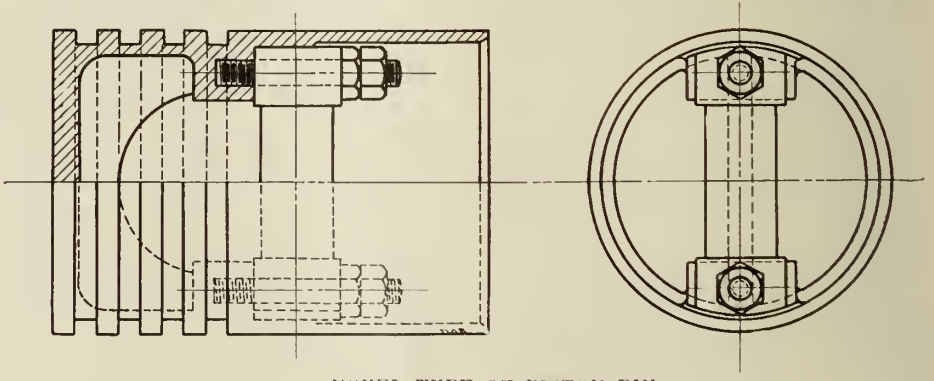
USEFUL WRENCH KINK.

wrinkle by any means, but it will save a great many steps when a pipe wrench is not at hand. Simply place a piece of a small round file between the pipe and wrench as shown and turn in the direction that will tend to jam it in more tightly, as the power is applied.

The scheme will not work satisfactorily unless the jaws of the wrench are fairly new and square.

A NOVEL TYPE OF PISTON PIN.

By D. O. Barrett.



N American firm building gas tractors of the twin cylinder horizontal type use a rather novel type of piston pin in their construction. The piston and pin are shown in the accompanying drawing. When the open end of the piston is bored, the bosses are faced off, and the shoulders bored to the proper dimensions at the same time. The pin is made of square steel, the central portion being turned to fit the bearing in the connecting rod. It is also turned on the ends, accurately fitting the boring which was previously done in the piston; this centres the pin accurately in both directions. The pin is held in the piston by means of a large stud on either side. Whenever it is desired to adjust the bearing on the engine, this is done without removing the piston from the cylinder. The nuts are removed from the piston pin studs, the pin slipped out of the piston, and the proper adjustments made on the rod. The pin is then slipped back into place, and the studs tightened.

This type of construction, while perhaps not indorsed by many designers, simplifies piston construction to a certain extent. The troublesome job of cross boring which must always be done in a separate operation, either on the drill press or the lathe, is dispensed with. Since the machining for the piston pin is done at the same time as the boring of the open end, it is an easy matter to use a turned plug fitting in the piston for holding same when turning the outside. This supports the piston for half its length and prevents a great deal of distortion at the centre.

AN OLD GEAR CUTTER.

By A. L. Loy.

THE writer recently ran across a gear-cutter, shown in the accompanying photo, in a gas engine plant. According to a statement made by an employee who had been with the company thirty-five years, the age of this cutter was somewhere between fifty and sixty years, and as will be noticed in the illustration, it is still used for gear cutting. While the machine may look a little antiquated, a careful study will show that its construction and method of operation is exactly similar to many of the latest automatic cutting-machines on the market.

NOVEL TYPE OF PISTON PIN.

The machine is not equipped with a power feed, although this could be very easily done. The hand-wheel seen at the left feeds the cutter back and forth. The

gear blanks are carried on the horizontal shaft, on the outer end of which is a large worm gear. The worm shaft is arranged for a set of spur gears to which is connected the indexing handle, at the opposite side of the machine. The proper gears are used so that the indexing handle may be turned through one revolution for each tooth to be cut. The indexing handle is attached to a rectangular bar, which is held in a corresponding notch by means of a spring. In indexing, this handle is pulled out and turned one revolution: the proper depth of cut being obtained by means of the hand wheel at the top. No outer support is provided for the blanks, although this could easily have been done. It is surprising, considering the age of this machine, that the work being turned out is of such a creditable nature.

AN OLD GEAR CUTTER.

Suction Device.—A small magnet on a long handle is an excellent thing to have about a motor repair shop for lifting small nuts, bolts, etc., out of obscure places. It is open to the objection, however, that it will serve only for iron or steel articles. To overcome this objection there has just been placed upon the market a somewhat similar device in which suction takes the place of magnetism. The lifter consists of a rubber suction cups at the end of a handle, which is hollow and which is connected to the hose leading to an exhaust pump. A small thumb valve affords control, and there is a hook for dislodging small articles. The device is intended primarily to lift sheet metal stampings from under die presses, but it is useful in many other ways.

DOING IT YOURSELF.

THE individuals whose lives are really valuable never asked anyone how to make them so. This is a great truth, but it has its danger. The truth in it is self-reliance and the danger is the neglect of experience. It is almost certain that no successful man ever owed his success to any book, written probably by an unsuccessful author, and entitled "How to Succeed."

The successful man as a rule maps out his own course and moves along it toward his goal by his own self-reliance. What experience of others he can get along the way he is willing to consider carefully and to weave it into his own fabric, if it seem to him to have a place there, but on the whole he is not a great asker of advice. He knows almost instinctively that sooner or later he has to take his own advice, and he knows that whatever has to be done he has to do it himself. The people who are for ever asking the advice of others and looking elsewhere than in themselves for the key of success are not very successful till they have discovered their mistake, and have set about doing the thing themselves. This is the Parable of the Talents over again.

What is this "iron string" within every successful man that vibrates only to this masterful touch? The strength of your life is measured by the strength of your will, but the strength of your will is just the strength of the wish that lies behind it. Is this wish some little personal pleasure that extends over a day or over a week and is gone, or is it a good will that runs over a lifetime and has a man behind it?

NEW STEEL CAR SHOPS.

(Continued from Page 473.)

the car, where the rivets are small and small errors in the location of the rivet holes are relatively serious. It is intended to handle the drilling of the long side members of the car in the same way as that of the side sheets. The drilling of the small side cover plates will also be handled on a jig by a small sensitive drill, and it is intended to use rollers and stops in order to minimize the cost as far as possible.

Assembling.

The same arrangement of an assembling jig is used in the passenger shop as was adopted in the freight, but the number of operations has been reduced to one; and the assembling, reaming and riveting of the underframe is done in one position. On account of the much greater length of the jig and the fact that the wall of the shop adjacent is considered as a temporary wall, in view of the probable extension of the shop, it was impossible to use a jib crane of any type because of the head room that it would require. A low crane runway was, therefore, adopted, with small traveling cranes to carry the riveters. With this arrangement the number of riveters needed can be increased indefinitely in proportion to the output of underframes required, which certainly could not be done in the case of jib cranes. It further enables the underframe to be lifted out in either direction. The underframe jig is located centrally in the shop in view of the probable future extension.

Erecting.

The noticeable feature of the erecting portion of the passenger shop is the arrangement of small bays running lengthwise over each track, the small traveling cranes just large enough to handle material or riveters as required, and a unique arrangement of scaffold posts short on one side so that the cranes can operate over them, but stiff enough to carry rivet furnaces for the roof work, men's tools, etc., or to serve for a backing for light drilling work on the side sheets or framing.

Special rivet furnaces are used for the heating of rivets to prevent the pitting so common in the ordinary oil furnaces. These muffle furnaces have given very good satisfaction, and while they are slow in heating up, burning of rivets and pitting is very materially reduced. In the passenger sections there are two positions on each track and four tracks. The output in the original lay-out of the shop was based on a 10-car output per month. It was thought that each car would stand ten days in each position and that the underframe would turn out a car for every two and one-half working days, but it is evident from the progress already made that a better output than this will readily be obtained.

In the first position the posts, end frame and complete frame work of the car are erected and side roof sheets and hood sheets are applied. As the car leaves the first position it is run on by the second position outside the shop, where it is sand blasted and then returned to the second position for finishing. In the second position the centre roof sheets and flooring, including vestibule trimmings, etc., are applied. The car is then sent over to the wood passenger shop for inside trimming and finishing. A transfer table is provided at the outside of the shop for switching the cars from track to track or to the outgoing track, and the sand blasting at the present time is done outside the shop between the shop and the transfer table.

Arithmetic for the Machinist and Workshop Operative

By J. H. Rodgers

With the further development of this course in arithmetic, it will be found by those who have followed the introductory lessons and profited by them that the various practical applications resulting from the succeeding lessons will be easily observed and their time and labor-saving features so appreciated as to be adopted at every available opportunity.

IN our April 23 issue the elements of trigonometry were discussed, and the different functions featured in diagrammatic and tabular form. The present lesson is a continuation of the foregoing, and deals principally with the practical application of the subject.

Example:—Required the sine of an angle of 36° 45′. From table, Chart 15, a° = 36°.

Sine of a° or 36° = .58779
Sine of a° +1° or 37° = .60182

d = .01403

Then by formula,

$$f_1 = f + \left\{ \frac{m}{60} \times d \right\} = .58779$$

$$+ \left\{ \frac{45}{60} \times \frac{.01403}{1} \right\} = .58779 + .01052$$

= .59831 = Sine of 36° 45′

Example:—Required the cosine of the angle 65° 36′.

f = cosine of a° or 65° = .42262
f of a° + 1 = cosine of 66° = .40674

d = .01588

Then by formula,

$$f_1 = f + \left\{ \frac{m}{60} \times d \right\} = .42262$$

$$= \left\{ \frac{36}{60} \times \frac{.01588}{1} \right\} = 42262 - .00953$$

= .41309 = cosine of angle of 65° 36′

Again:—Required the angle whose tangent is 2.82436.

a°₁ = required angle.

Looking in table, we find that this number falls between the angles 70° and 71°, then

tangent of a° or 70° = 2.74748
tangent of a° + 1° or 71° = 2.90421

d = 15673

d_1 = 2.82436 − 2,74748 = .07688

By formula,

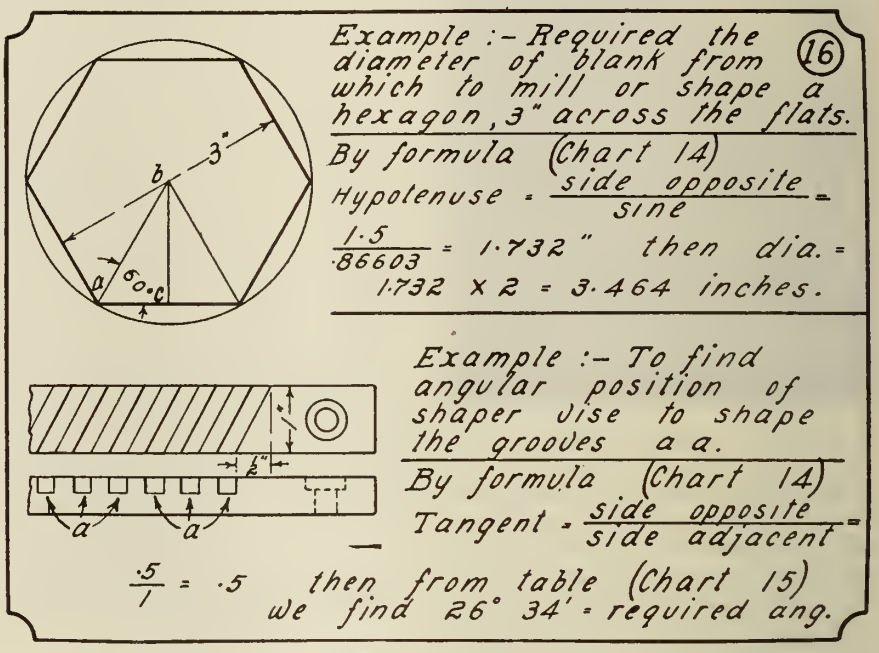
$$a°_1 = a° + \left\{ \frac{d_1}{d} \times 60 \right\} \text{ min.} =$$

$$70° + \left\{ \frac{.07688}{15673} \times \frac{60}{1} \right\} \text{ min.} = 70° \ 30' \text{ nearly.}$$

Practical Application.

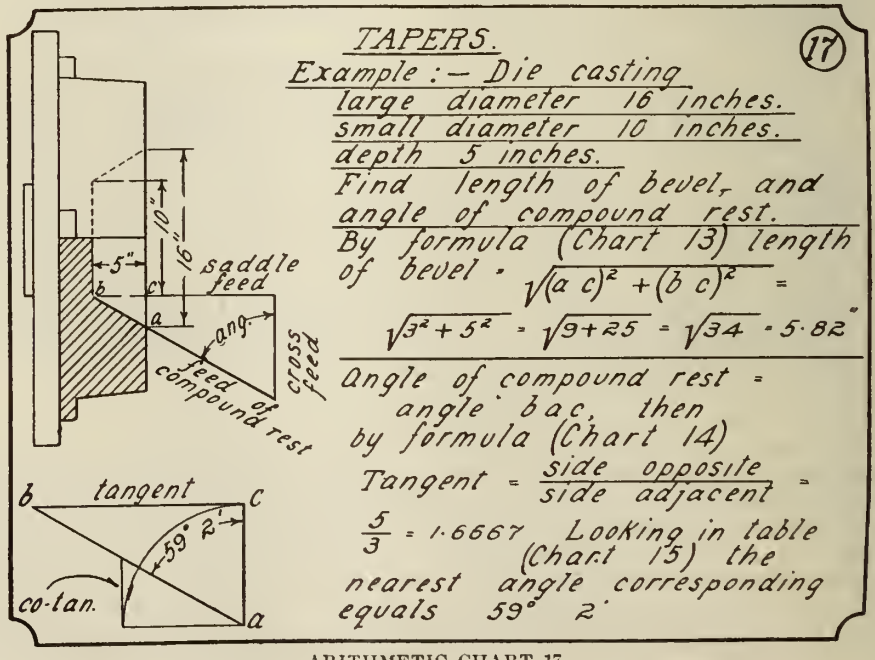
Charts 16 and 17 show the practical application of trigonometry to some of the problems of everyday work.

A blank is required from which a hexagon is to be milled, to measure 8 inches across the flats. (Chart 16).



Angle (bac) = 60°;

length (b.c.) = 8 ins. ÷ 2 = 4 ins.; then hypotenuse or length (a b) =



$$\frac{\text{side opposite}}{\text{sine}} = \frac{4}{.86603} = 4.62 \text{ inches.}$$

Diameter of blank = 4.62 × 2 = 9.24 inches.

In a bar 1½ inches wide and similar

ARITHMETIC CHART 16.

ARITHMETIC CHART 17.

to that shown in Chart 16, a number of grooves are to be cut, the advance of one side over the other being ⅝ inch. Required the angular position of vise to shape the grooves.

In this case, the two sides of the right triangle are known; then from formula, Chart 14, we have

$$\text{tangent} = \frac{\text{side opposite}}{\text{side adjacent}} = \frac{.625}{1.5} = .41667$$

Looking in table, Chart 15, we find this number lies between 22° and 23°.

For closer calculation we use the formula at foot of the table:

$$a^\circ_1 = a^\circ + \left[\frac{d_1}{d} \times 60\right] \text{ min.}$$

$$d = .41667 - .40403 = .01264$$

$$d_1 = .42447 - .41667 = .00780,$$

then,

$$a^\circ_1 = 22^\circ + \left[\frac{.00780}{.01264} \times \frac{60}{1}\right] \text{ min.} = 22^\circ\ 37'.$$

Again, a die casting, similar to that shown in Chart 17, is to be turned to have a depth of 6 inches, large diameter 15 inches, small diameter 10 inches. What is the angular position of compound rest?

In the right triangle (a c b), we know the dimensions of the two shorter sides, that is 6 inches and (15-10) ÷ 2 = 2.5 ins.

Angle required = (b a c)

Then by formula, Chart 14, we have

$$\text{tangent} = \frac{\text{side opposite}}{\text{side adjacent}} = \frac{6}{2.5} = 2.40000$$

Looking in table we find this number to be between 67° and 68°.

By formula, Chart 15,

$$a^\circ_1 = a^\circ + \left[\frac{d_1}{d} \times 60\right] \text{ min.} =$$

$$a^\circ + \left[\frac{.04415}{.11924} \times \frac{60}{1}\right] = 67^\circ\ 22'.$$

THE LENNOX THROATLESS ROTARY SHEAR.

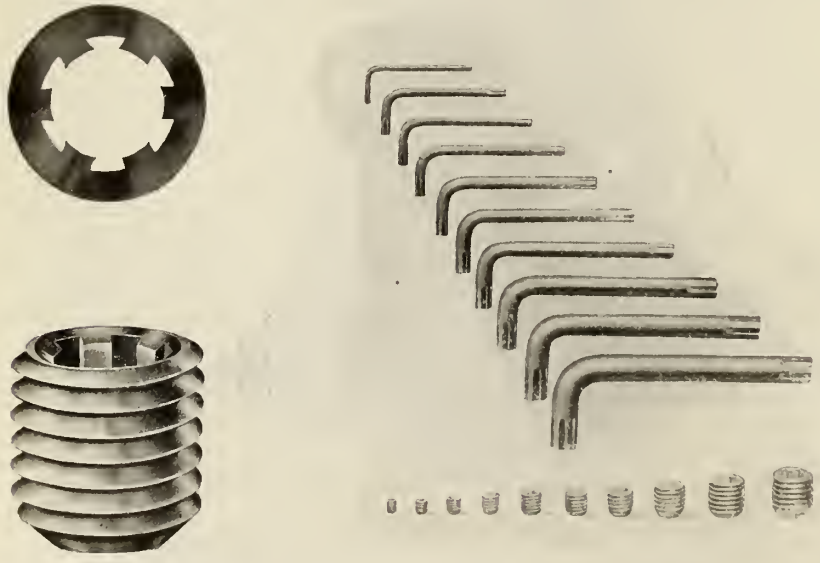
A UNIQUE type of shear, designed for straight, serpentine, and irregular cutting of sheet metal is being made by the Canadian Lennox Throatless Shear Co., Toronto, Ont. One of the most noticeable features of this machine is the absence of the "throat" section, which makes it possible to handle plates or sheets, regardless of length or width.

The accompanying illustration shows the general design of the shear, and the novel shape of the frame will be noted. The frame is designed in the form of a helix, so that it allows the plate, while being cut, to separate naturally—one side to the left-hand moving freely in a horizontal direction, while the right-hand part moves in a downward direction. Another prominent feature is the wide range of irregular cutting that can be done. Any irregular line can be easily followed, or swinging from one curve to another, either right or left, or in a straight line. Circles and reverse curves are, it is claimed, executed rapidly, while a perfectly smooth edge results. It is also claimed for this shear that in doing irregular work, 75 per cent. can be saved in cutting costs compared with hand and old-style power shears, besides producing much better work.

The cutting is done by two rotary cutters made of high-grade tool steel. The upper cutter is positively driven, and is slightly knurled on one face, to feed the metal, while the lower cutter shaft is housed in an adjustable sleeve and runs free. Adjustment of cutter is made in this sleeve to suit the different thickness of the stock, or for the slight reduction in cutters after regrinding. The shear is simple in construction and is easy to operate, being also rigid and compact, that illustrated being 60 in. high, and weighing 650 pounds. The head is a solid steel casting, while the base is made of cast iron and occupies a floor space of 26 inches square. The gears are of steel and iron cut from solid blanks, and guarded. The machine is equipped with a clutch pulley 12 in. in diameter and of 3-in. face, dispensing with the need of a countershaft.

The shear illustrated will cut No. 10 gauge steel plate and lighter stock with a limit of 4½ in. radius. Other sizes are being put on the market, and these will have cutting capacities for ¼-in., ⅜-in. and ½-in. steel plates respectively.

"LENNOX" THROATLESS ROTARY SHEAR.



DEVELOPMENTS IN MACHINERY

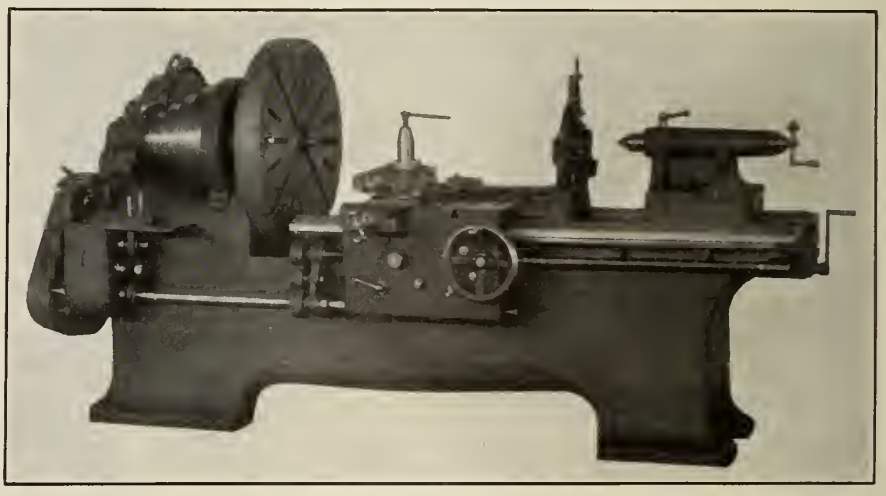
A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

NEW PATENTED SAFETY SET-SCREWS.

THE Bristol Company, Waterbury, Conn., has recently put on the market a new and improved line of "BRISTO" Patented Safety Set-screws as shown in the accompanying illustration. These are manufactured under the Goodwin patent of October 14, 1913, and the patented design is shown in the cross section, from which it may be seen that there are six dove-tailed slots inside the hollow head of the set-screws, and six corresponding flutes on the outside of the special wrenches used with these. The dovetailed design is such that when the set-screws are set up hard with the special wrench, the latter gives the screw a true rotary motion without the usual tendency to expand and crack the hollow head. The angles of the surfaces of the slots are such that there is just a tendency for the wrench to contract or compress the head of the screw. The screws are manufactured in a great variety of sizes, a few of which are shown. A special treatment process is used which makes the screws glass hard on the outside and extremely tough on the inside, and samples have been found in actual test to be 100 per cent. stronger than the old hexagon style set-screws.

The "Safety First" movement has progressed so far that great attention is now being given to changing the design of machinery to protect human life and the elimination of the old style set-screws with projecting heads is one of the things on which safety engineers and insurance inspectors insist. At the First International Exposition of Safety and Sanitation recently held in New York City, a silver medal was awarded the Bristol Co. for its exhibit of safety set-screws.

BRISTO PATENT SAFETY SET SCREWS AND WRENCHES.



HEAVY "BARNES" GAP LATHE.

THERE is being placed on the market by the Barnes Drill Co. of Rockford, Ill., a heavy sliding extension general purpose gap lathe with 22-36-in. swing and 8½-ft. bed. It has been particularly designed for general repair shop use and for some lines of manufacturing work requiring a lathe of large swing, but which would not warrant the expense of a standard 36-in. lathe.

Special attention has been given to strength, rigidity and power, as well as convenience, durability and accuracy commensurate with a wide range of work.

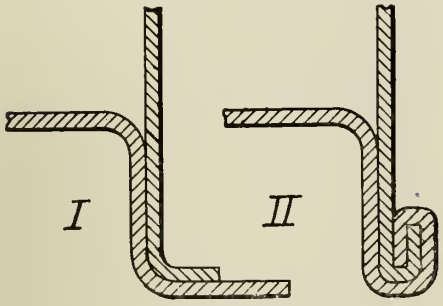
The main and sliding beds are planed and scraped together. They are unusually heavy and broad, and are braced so as to give the maximum strength and rigidity. The top bed is particularly wide (24⅞ in.), extending beyond the main bed so as to provide a support for the carriage when turning work of large diameter through the gap, the object being to do away with a special brace for this purpose.

The cone steps are of large diameter,

HEAVY "BARNES" GAP LATHE.

and are designed for a 3-in. belt. The lathe is also powerfully back-geared, and the extension gap gives a capacity for a large variety of work.

The regular equipment furnished with the lathe consists of countershaft, steady rest, follow rest, large and small face plates, centres, wrenches, and full set of change gears. The weight with 8½-ft. bed is 5,300 lbs., and for every 2 ft. extra length of bed 600 lbs. additional.

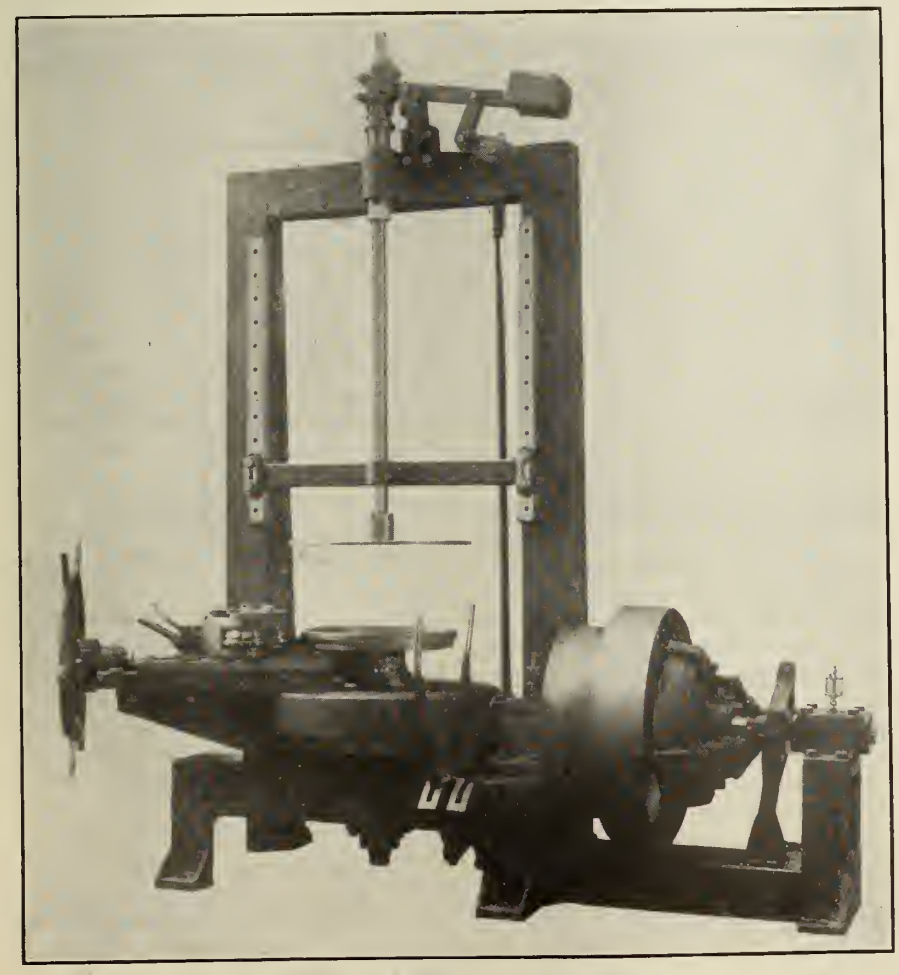


HEAVY NIAGARA DOUBLE SEAMER.

TO meet the increasing demand for heavy metal barrels and tanks with double seamed ends, the double seaming machine shown in the accompanying half-tone has been placed on the market by the Niagara Machine & Tool Works, Buffalo, N.Y.

Before the seaming operation takes place, the cylindrical bodies and ends have to be prepared as shown in Fig. 1—i.e., the bodies have to be flanged in a

flanging machine, while the disks have to be stamped with a depression and flange by means of press and dies. Fig. 2 shows a double seamed joint.



The machine is throughout of heavy and massive construction, and particular attention has been given to arranging the controlling levers most convenient for the operator, thus obtaining a

PROGRESS OF SEAMING.

maximum output. The vertical seaming chuck spindle is driven from the pulley shaft by means of a pair of bevel gears, and an adjustable end thrust bearing is provided for the vertical main shaft as well as for the top clamping plate. The latter can be adjusted for work of different height, and is raised and lowered by means of a hand lever actuating a pair of toggles.

A band lever controls the motion of the machine by means of a friction clutch. The seaming roll turret is mounted on a slide, the latter being operated by means of a screw and band wheel. Change gears are provided, giving the screw two different speeds. The machine will double seam material as heavy as No. 12 gauge, from 12 to 32 in. diameter and from 6 to 44 in. in height.

HEAVY NIAGARA DOUBLE SEAMER.

Handy Practical Data on Grillage Foundations

By H. Womersley

The officials of machine shops and foundries in contradistinction with the heads of other branches of industry, are expected to have at least a conversant knowledge of nearly every other trade. This handling of the above subject is intended to denude it of its usual cloud of theory and thus make it available for the man who must show practical results for all his time and exertions.

STEEL grillage foundations are now very generally adopted in cases where the load from a stanchion must be spread over a considerable area. For heavy loads or bad bottoms, the depth of a properly designed grillage foundation may be made very much less than is required for a solid concrete block, with the consequent large saving in cost of concrete, and of excavation. The nature of the soil where the foundation has to be built should be carefully examined, and if necessary, tested to determine the maximum safe load per square foot which may be applied. From this, and the total load to be carried, the required area of the foundation can be at once determined. After the ground has been excavated to the desired depth, and the surface approximately leveled up, a layer of at least 6 in. of good concrete should be laid; this is necessary to insure the regular spread or distribution of load over the whole area, and at the same time to present a level surface on

Weight of Joist per ft. in pounds	Dimensions in Inches Depth	Width	Sectional Area	Distributed Safe Load Coefficient
4 to 5·5	3	1·5	1·17	5·52
8·5 " 10	3	3	2·50	12·6
9·5 " 13	4	3	2·79	18·8
10·5 " 14	5	3	3·23	27·2
18 " 22	5	4·5	5·29	45·4
19·5 " 23	6	4·5	5·88	57·7
23·5 " 27	6	5	7·35	72·7
18 " 23	8	4	5·29	69·6
26·5 " 30	8	5	8·24	117·7
32 " 38	8	6	10·29	138·2
28·5 " 33	10	5	8·82	145·7
40 " 47	10	6	12·36	211·6
51 " 57	12	6	15·88	213·0

PRACTICAL DATA ON GRILLAGE FOUNDATIONS.

which the lower tier of grillage beams may be set.

Grillage beams should be spaced at least 3 in. apart between flanges (being held in position by means of separators and bolts); this clearance is necessary to enable the concrete to be efficiently packed in between the several joists. It is not necessary to paint the grillage joists if they are cleaned and reasonably free from scale as the cement will adhere better to the unpainted surfaces.

When all beams are in position and the columns set up, the whole of the steelwork should be protected with at least 6 in. of concrete to prevent rusting and deterioration. In the case of very heavy loads, it will sometimes be found necessary to consider carefully the shearing or buckling tendency in the webs of the grillage joists, but if these be efficiently supported by means of the concrete packing between and around them, the safe shearing or buckling value may sometimes be taken as high as one-half that of the crippling strength, with the addition of the support got directly from the concrete it-

self. Light column foundations can usually be formed with one or two tiers of joists; heavy columns may require three or even four tiers.

For a single column, the usual shape of foundation is square or oblong, but any shape may be adopted, so long as the column rests on the centre of gravity of the area. Where two or more columns rest on one block, they should be so placed that the resultant of the several loads shall coincide with the centre of gravity of the area. This is necessary to insure that the load is uniformly distributed over the whole surface of the foundation.

Grillage Calculations.

The calculations necessary to determine the size of grillage joists are very simple as the following formulae and sketch will show.

Equivalent safe distributed load on 1 ft. span=4 psv², where

W=Total load from stanchion in tons.

p=pressure per sq. ft. on area of any tier of joists in tons.

v=overhang of joist in any tier in feet. (B in sketch).

s=spacing of joists in any tier in feet (A in sketch).

The following example will explain the method of procedure.

Let total load W on stanchion=350 tons, and let maximum safe bearing strength of soil=2½ tons per sq. ft.; then required area for foundation

$$= \frac{350}{2\frac{1}{2}} = 140 \text{ sq. feet.}$$

Adopt grillage base 12 ft. × 12 ft., and base of stanchion as 3 ft. square.

Assume top tier 7 ft. × 3 ft., middle tier 12 ft. × 7 ft., and lower tier 12 ft. × 12 ft.

Values for the spacing (s) can be adopted so that the joists will work out in convenient sizes.

1st tier, $P = \frac{350}{7 \times 3} = 16.67$ tons;

$$v = \frac{7-3}{2} = 2 \text{ ft.}; \quad S = 9\frac{1}{2} \text{ in.}$$

2nd tier, $P = \frac{350}{7 \times 12} = 4.16$ tons;

$$v = \frac{12-3}{2} = 4\frac{1}{2} \text{ ft.}: \quad S = 11 \text{ in.}$$

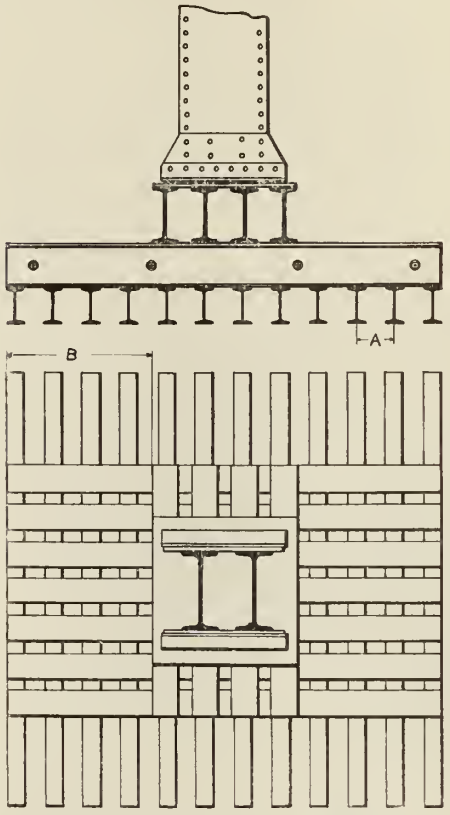
3rd tier, $P = \frac{350}{12 \times 12} = 2\frac{1}{2}$ tons,

$$v = \frac{12-7}{2} = 2\frac{1}{2} \text{ ft.}; \quad S = 12\frac{1}{2} \text{ in.}$$

Equivalent safe distributed load $= 4 \times 16.67 \times \frac{9.5}{12} \times 2^2 = 211$. From the table for this value we get a beam 10 in. × 6 in. × 42 lbs. for first tier.

For second time we likewise get

$$4 \times 4.16 \times \frac{11}{12} \times 4.5^2 = 309, \text{ or a beam}$$



12 in. × 6 in. × 54 lbs.

For third tier, the size of beam is

$$4 \times 2.5 \times \frac{12.5}{12} \times 2.5^2 = 65$$

= 8 in. × 4 in. × 18 lb.

The above method of designing footings is simple and such that a contractor could adopt and obtain fairly reliable values without the help of a high-priced engineer.

PRACTICAL DATA ON GRILLAGE FOUNDATIONS.

POWER TRANSMISSION BY ROPES.

AN exhaustive paper on "The Transmission of Power by Ropes," was recently contributed to the "Proceedings" of the Textile Institute by Mr. Edwin Kenyon. After alluding to the conflicting experiments which have been carried out in Germany and the United States on rope transmission, the author said that with a well-designed installation in which good cotton ropes are used the index of centrifugal detraction might be safely removed a considerable distance beyond the 4,500 ft. velocity determined by the American tests. While it might not be advisable to push the proposition of constant power transmission by ropes to the utmost limit of mechanical endurance, which might mean a rim speed of 20,000 ft. or 30,000 ft. per minute for a properly made steel pulley, all the evidence obtainable from actual experience went to prove that we might safely reckon upon a continued accession of power in the ratio of speeds up to at least 7,000 feet per minute.

Mr. Kenyon then went on to describe actual systems of transmission in proof of his assertion. In support of his case he mentioned the fly-rope pulleys at three cotton mills, one in Lancashire, one in Scotland, and another in Spain. They are all 28 ft. diameter, making 80 revolutions per minute, or a peripheral speed of 7,037 feet. At the first mentioned mill, two ropes, 1⅝ in. diameter, drive each of the five spinning-rooms, while the entire load of the card-room, representing 286 horse-power, is taken by three ropes averaging 95 horse-power each. The record power, however, appears to have been reached at another mill in the same neighborhood, where two 1¾ in. ropes are credited with transmitting no less than 450 horse-power at 7,200 ft., from a driving pulley 15 ft. on to a driven pulley 5 ft. 6 in. diameter.

The author then proceeded to criticize the American system of continuous rope driving, which entails the use of jockey pulleys, mounted upon a weighted carriage, designed for the purpose of maintaining an equality of tension which is never realized. A serious defect of this system of driving is that of having to depend upon one rope, the splicing of which has a habit of giving way, involving long stoppages during the process of replacement; whereas in the English system a damaged rope may be laid aside awaiting a favorable time for repairs, while the rest do the work. When it is added that Manila ropes running in shallow, open grooves of 60 deg. were used in the American experiments referred to, the author states that anything more conducive to loss of efficiency due to unnecessary friction, creep, slip, and lack of impact would be difficult to conceive.

A series of different adaptations of rope transmission were then described, and the author proceeded to consider the formation of rope pulley grooves. He said that for all-round good service there was nothing to beat the flangeless groove with the driving angle carried through to the terminals. The angle recommended is 40 degs., except in the cases of thin bands, such as are used on cotton mules.

Wettlaufer Bros., makers of concrete mixers, power hoists, and steam shovels, have opened a branch at Regina, Sask., under the management of Mr. A. E. Hodgert.

BOILER QUESTION GROWING ACUTE.

THE different provinces of the Dominion, according to present expectations, will send representatives from their local government boiler inspection branches to confer at Toronto in July, in order to strike a uniform regulation for Canadian inspectors. For a year the matter has been hanging fire and the enormous traffic in boilers together with the importance of having reliable machinery has influenced Deputy Minister of Works Fairbairn to issue a convention call.

The stand of Ontario will be for boilers built subject to its provincial regulations, accepted at face value in the western provinces. At the present time, regardless of the fact that Ontario has very stringent rules in existence, Alberta and Saskatchewan sometimes feel it incumbent to cut down the pressure. In consequence manufacturers here are handicapped in their trade.

Arrangements are also under way to have inspectors in connection with the large American insurance companies particularly interested in boilers conform to the regulations obtaining here. This would relieve the necessity of much "border" examination which now goes on.

Since the new rules came into force last July, 791 mechanisms have been examined and approved.

WORM GEARING.

A PAPER on "Worm Gearing: Its Manufacture," was recently read before the Keighley Engineering Society by Francis J. Bostock, A.M.I. Mech. E. The author first enumerated the conditions essential to insure successful gears, the relation between the speed, pressure, etc. He then described the earlier methods of making worm gearing, and concluded with a description of modern methods and machines as used in the works of David Brown & Son (Huddersfield), Limited. He said the advent of the motor car had given a great impetus to the worm gear, and in the next few years he anticipated that this form of gearing would be universally used for the final transmission on motor cars.

Features of a Successful Gear.

The author then went on to describe the terms used and the theoretical conditions which have to be fulfilled in order to obtain a successful gear. He said there were many factors entering into the design of worm gearing. The worm angle, for instance, bore an important relation to the efficiency and durability. For many years designers did not realize the importance of having a high lead angle. He said that the maximum efficiency was obtained when the lead angle approximated 43 degs., 40 mins., and that 50 per cent. efficiency obtains when the worm angle is equal to the angle of friction, at which point the worm is non-reversible. The importance of a high worm angle could not be too strongly emphasized. In order to obtain this angle it was necessary to reduce the diameter as much as possible to get a better angle and the minimum of rubbing velocity.

With regard to rubbing velocity and its relation to the pressure area of contact the author contradicted the statement frequently made that the pressure multiplied by the velocity was constant. This, he said, was not so, as it would mean that an increase of velocity would be accompanied by a corresponding decrease of pressure. The lower the velocity, the higher the permissible pressure, and vice versa.

Contact Area.

The next factor referred to was the area in contact. The author said it was often supposed that the whole of the surface was useful. This was not quite so. On the leaving side of the wheel face, the useful part falls off very rapidly from the centre; in some cases only 60 per cent. of this side was useful. Again, it was possible to get contact over several teeth, which in poorly designed gears was only interference and useless for load-carrying purposes, merely giving rise to frictional losses. There was not always the equivalent of two teeth in contact. There might be contact on portions of three or more teeth, but when projected on to the side view of the wheel this gave only the equivalent of two or less. On an average he might say that 1.4 times the projected area was useful. A finer pitch would give more teeth in contact, but a less projected area, whilst a coarse pitch gave a greater area and a lesser number of teeth in contact, the advantage appearing to be in favor of the latter. The centre distance required for the transmission of a certain horse-power at 1,000 revolutions per minute varied approximately as the $\sqrt[4]{}$ ratio and the $\sqrt[3]{}$ h.p.

The amount of heat generated was another factor to be considered. The author said that when the temperature of the gears reached about 250 degs. Fah., the oil film broke down and the lubricating value ceased. This temperature rise was the limiting factor in the capacity of gears. Usually they were run at a temperature of 175 degs. Fah.

C.M.A. CONVENTION.

PRELIMINARY arrangements for the Convention of Canadian Manufacturers' Association of the Dominion, to be held in Montreal in June, were talked over at the annual meeting of the Montreal branch of the association held in the Canada Club rooms on May 5, when the election of officers for the ensuing year took place.

Improving or satisfactory conditions of trade were reported, and, in referring to the matter of Canadian industries, Howard Murray, the retiring chairman, stated that the output of Canadian factories had now reached a level equal to the demand for the products in Canada, and that new foreign markets must, therefore, be looked for in the near future. In the election of officers, T. P. Howard, of the Phoenix Bridge & Iron Works, was chosen chairman and T. R. Wardleworth, of the National Drug & Chemical Co., vice-chairman by acclamation.

WESTERN CROP FIGURES.

WHEAT seeding is drawing to a close in the West and a few days more will probably see the drill hauled off nearly all farms in Saskatchewan and Alberta and on a great many farms in Manitoba. Generally speaking, there will be but a slight increase in the wheat acreage, a substantial increase of ten to fifteen ped cent. in oats and barley and a marked decrease, probably fifty per cent., in the flax acreage. It is estimated the acreage will be substantially as follows:—

Manitoba—wheat, 2,650,000 acres; oats, 1,395,000 acres; barley, 500,000; flax, 70,000.

Saskatchewan — Wheat, 5,400,000; oats, 2,664,000; barley, 292,000; flax, 60,000.

Alberta—Wheat, 1,556,000; oats, 1,750,000; barley, 185,000; winter wheat, 175,000; flax, negligible.

Total—wheat, 9,871,000 acres; oats, 5,810,000; barley, 978,000; flax, 130,000.

Manitoba reports about 55 per cent. of wheat seeded with 90 per cent. completed in some districts. The acreage is practically unchanged. Saskatchewan reports 85 per cent. of wheat in the ground and Alberta 90 per cent.

Alberta is the only province to report a substantial increase in wheat acreage, exceeding last year's total by 300,000 acres. There is little old grain to market in any province and general conditions are excellent.

The Laurentide Company, of Grandmere, Que., recently closed two large contracts. One of these was for export of newsprint to Australia and the other was for a Texas concern. The output of the Laurentide Co. was sold practically for the entire twelve months in advance of the opening of 1914, and the new contracts, it is understood, are largely for delivery late in the year.

CUTTING OFF SMALL STOCK.

IN making a tour of a number of shops one cannot help but be impressed with the many and various means adopted for cutting off tool steel and other small stock in the tool room. Many still use the rough and ready way of grinding tools off the bar at the cost of considerable time and material.

One man effected a great economy in high speed steel by having the annealed bar cut up into useful lengths by a boy with a hack saw; the process naturally being pretty hard on saw blades. Another went a step further by cutting the pieces off at the angle to give proper clearance to the tools and thus saved considerable grinding. A well known method which seems to be little used except by the makers and dealers in tool steel is that by means of the steel disk. The apparatus is so simple that it can be easily made in any shop and, probably for this reason, is not much advertised by specialty manufacturers. We have seen several abortive attempts to operate these disks on the emery wheel arbor. The necessary requirement of this machine is proper speed of the rotating disk which should be from 4,000 to 5,000 revolutions per minute according to its size. The disks can be made of any thickness from 1-32 in. up and will cut hard or soft steel as well as other metals quickly, with little waste and at any angle required.

ADVERTISING MISUNDERSTOOD.

AS fire is to the manufacturing processes so is advertising to the commercial side of industry useful, essential and dangerous. It is strange but certainly true that the impression created by an ever present and attractive advertisement will strongly influence the average buyer of machinery in favor of the article thus advocated. He will place the convictions received from the publisher side by side with the results of actual investigation.

Like all other useful means attached to our social economy, this power is sometimes abused or debased to a wrong purpose. About eight years ago there was placed on the market a certain, at the time well-known machine which was introduced, particularly throughout the West, by a most vigorous and well managed advertising campaign. The result is that fully half the middle-sized shops one visits, have at least one of these machines in the attic or the cellar along with the other "has-beens" and their advent and brief existence are now but incidents of memory. This machine could not fulfill the claims set forth for it in the advertisements of its sales agents, and furnishes one of a number of examples that have borne out the statement of one of our greatest teachers of salesmanship, "A judicious and aggressive system of advertising will sell anything."

It must be remembered that an advertisement is a statement made by the man who wishes to sell the machine and that the advertiser is strongly tempted to tell but one side of its story. While statements that are obviously untrue would not be printed by a reputable publisher, still the man who pays for the privilege is entitled to set forth all the peculiar advantages of his product and in such reasonable language as he sees fit.

The purchaser, on the other hand, need not place himself in a position to be defrauded by an advertisement. Reliable manufacturers are satisfied to use the press as a method of introducing their commodities and are willing to demonstrate the value of their products. All others have no place in connection with a business that is run upon careful conservative lines.

Precocious advertising in itself is seldom the real reason for the non-realization of the qualities expected of a new machine. Cheapness of the appliance, and lack of mechanical judgment on the part of the buyer are often the culprits whose sins are charged to misrepresentation.

When machines are bought which do not fulfill the buyers' idea of their necessary qualifications, it should sound a warning note for the manager. The buying department is in the hands of incompetent persons.

INDUSTRIAL NOTABILITIES--No. 34

MAJOR REUBEN WELLS LEONARD, Corps of Guides, Canada, and Chairman of National Transcontinental Railway Commission of Canada, headquarters, Ottawa, was born at Brantford, Ont., February 21, 1860, the son of the late Francis Henry Leonard, Merchant, (and one time Reeve of County of Brant,) and Elizabeth, daughter of the late Captain Richard Catton.

He was educated at Brantford Collegiate Institute, and Royal Military College of Canada, Kingston, whence he graduated in 1883, winning the silver medal.

He served in North-west Rebellion in 1885, as Staff Officer of Transport, and in other capacities, after two years experience on the engineering staff of the C. P. R. on surveys and construction, Lake Superior District. After the rebellion he again took service with the C. P. R. as Engineer on surveys and construction, in Manitoba, Quebec, Ontario and British Columbia, sometimes as Chief Engineer and Manager of construction of important branches.

From 1887-90 he was Chief Engineer of the Cumberland Railway & Coal Co., N.S., and from 1898-1901 he was Chief Engineer and Manager of construction of St. Lawrence and Adirondack Railway, and Consulting Engineer of Rutland Canadian Railway, and Chief Engineer of Cape Breton Railway.

MAJOR REUBEN WELLS LEONARD.

In 1892 and 1893, 1904-5 and 1905-6 he was in charge of construction of Hydro-Electric Power Plants at Niagara Falls, Ont., for the Park and River Ry. Co.; at St. Catharines, for the Hamilton Cataract Power Co., and near Fort William, for the Kaministiquia Power Co., respectively. In 1906 he promoted the Coniagas Mines Ltd., of which Company he has been President since its inception. This office he has also continuously held in the Coniagas Reduction Co., which he organized in 1908.

Aside from his railway duties and private interests, Major Leonard finds time to interest himself in other matters, and is a member of the Board of Governors of Toronto University and Kingston School of Mining; Wycliffe College of Toronto, and Bishop Ridley College, of St. Catharines; and Chairman, St. Catharines Consumptive Hospital.

He is past Vice-President of the Canadian Mining Institute; a past Vice-President of the Canadian Society of Civil Engineers; a member of Council of the Institute of Mining and Metallurgy, London, Eng.; a member of the American Institute of Mining Engineers, and a past President of the Royal Military College. His clubs are Rideau and Country, of Ottawa; National, of Toronto, and Mount Royal, Montreal, and his tastes are in the direction of outdoor sports.

He married Miss Kate Rowlands, daughter of the late John Rowlands, of Kingston, Ont., and his residence is at St. Catharines, Ont.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., May 11, 1914.—Though the more seasonable weather of the past week has had some effect in stimulating certain trades, the improvement has not been as great as might have been expected. However, business men display an optimistic spirit regarding the near future. In fact, some firms state that trade in most lines is quite good, all things considered. Drummond, McCall & Co. report a good, steady volume of business in Montreal and the East in plates, tubes, sheets and other classes of steel. There is, however, little demand for pig iron.

Considerable interest is being evinced locally in the outcome of the debate on the Canadian Northern loan guarantee of $45,000,000, which will commence at Ottawa to-morrow. The estimates are understood to provide for an expenditure of $27,000,000 for new rolling stock, and this would mean considerable business for the various car and locomotive builders of the Dominion. It is hoped that the matter will be satisfactorily settled by the end of this week.

The Montreal Box Board Co. have purchased a factory on Seigneurs Street, on the banks of the Lachine Canal. They are remodeling it for the manufacture of box board from waste paper, and will shortly be in the market for machinery. This factory will go into operation early next fall.

The metal market continues very quiet, consumers pursuing a "hand-to-mouth" policy in their buying. As predicted last week, tin has dropped 1 cent per pound. There is a probability that a slight reduction in sheets may be made shortly, and other lines of steel, such as boiler and tank plates, tubes, etc., may fall 5 cents per 100 lbs.

Toronto, Ont., May 12, 1914.—While trade conditions show no material change over what we have been experiencing during the past few weeks, it is probable that a slight improvement may be seen in the near future. Favorable reports from the West will do much to restore confidence in business circles, although we do not anticipate an early return of anything like the same conditions as were prevalent during the same period last year.

There appears to be plenty of money in the country but the rates charged on loans are still too high. This is having an unfavorable effect on the building trade which shows a marked falling off from last year. The permits issued locally for April are considerably less than for the same month last year, and the same remark applies to the majority of cities throughout the country. There appears, however, to be an improvement this month in building operations.

Interest in the new Union Station will be revived now that the plans have been adopted by the Dominion Railway Commissioners, and orders issued for a start to be made on the work. The slight modifications suggested by the City may be made as the work of construction proceeds.

The Provincial Hydro-Electric Commission has ordered a reduction in rates for electric light and power, to be made by the Toronto Hydro-Electric Commission, to go into effect on June 1. The matter is under consideration and a decision will be announced in a week or two. If the new rates go into effect, they will be of considerable benefit to power users, the discount having been increased 10 per cent., in addition to a reduction of 2 cents per kilowatt hour, in certain cases.

The steel market is weaker than at any time during the year, a new low level having been reached. Lake Superior Producers have reduced iron ore to $2.80 per ton, f.o.b. Duluth, bringing the price back to the 1912 basis, which leaves a margin of 30 cents a ton profit. Steel bars have weakened and are now being quoted at $1.15, Pittsburgh. The National Tube Co. has announced a reduction of $2 a ton on boiler tubes and $1 a ton on 2-in. line pipes. Steel plants in the United States are operating at about 60 per cent. capacity, with little hope of improvement for some time.

Prices of American pig iron remain at the same level, the reduction in ore having apparently been anticipated by the furnaces. The production of pig iron in the United States for April shows a decrease over March. The market may show a little more activity in the near future in anticipation of second half requirements.

No change is to be noted in the machine tool market, business being distinctly quiet. The local Board of Education are receiving tenders for three 15-in. motor driven lathes, a drill press and a number of small tools and supplies.

The general condition of the metal market shows practically no change and the amount of business being done is hardly up to expectations. The market is inclined to be weak.

Ottawa, Ont., May 11, 1914.—Morning sessions of the House of Commons started this week, which means the beginning of the end of what has been an exceedingly important session from the standpoint of the business and commercial world. This session has seen the putting in force of a new tariff, which through its effect on the steel and iron industry vitally interests the whole realm of Canadian manufacturing, and particularly the machinery business.

Again, this session will see the sanction of the C. N. R. agreement by which the Government lends its credit to the road to the extent of $45,000,000, and becomes a minority stockholder in the system, owning $40,000,000 out of the $100,000,000 capital stock of the re-organized company.

The announcement that the Government had come to the rescue of the road has had a good effect on the general business situation. There may be differences of opinion as to whether the Government should have agreed to become a junior partner in the C. N. R. system. Yet they had to do something or else see the line go into bankruptcy, with

all the dangers of such a proceeding to the business fabric of the country.

In view of the fact that Canada will soon be a two-fifths stockholder in the road, the following statement of net earnings of the present lines included in the C. N. R. is of more than ordinary interest:

Canadian Northern Railway, $7,023,-868.

Canadian Northern Ontario Railway, $50,311.

Canadian Northern Quebec Railway, $285,961.

Quebec & Lake St. John Railway, $135,533.

Central Ontario Railway, $132,024.

Bay of Quinte Railway, $36,220.

Irondale, Bancroft & Ottawa Railway, $6,417.

Niagara, St. Catharines & Toronto Railway, $148,455.

Halifax & South Western Railway, $3,121.

Brockville, Westport & N. W. Railway, $25,298.

Duluth, Winnipeg & Pacific Railway (es.), $613,890.

Total, $8,461,098.

On capitalization, the two money-makers of the system are the Niagara, St. Catharines & Toronto Railway, and Duluth, Winnipeg and Pacific Railway.

Two exceedingly important measures to the business world which have already received third readings are the bills in regard to the incorporation of Trust and Loan Companies. Both bills greatly safeguard the public. The Railway Act and Amendments to the Insurance Act, two other measures of more than ordinary interest to business men, will, however, go over until next session.

Hon. C. J. Doherty introduced a bill this past week, which, while it does not directly affect machinery interests, is of interest to all business men and will be generally welcomed by them. It is a bill to make it a criminal offence to knowingly publish misrepresentations in regard to the sale of property, particularly real estate. This should tend to put an end to some of the glowing, misleading Western advertising.

Yesterday notice was given of the bill of Hon. Arthur Meighen to establish agricultural credit banks. This bill will greatly facilitate the establishment of the rural credit bank, an institution imported from Europe, but already extending in Quebec and Ontario.

MONTREAL LIGHT, HEAT AND POWER.

SURPLUS earnings of the Montreal Light, Heat and Power Co., that is, earnings available for dividends, for the year which ended April 30, will cross the $3,000,000-mark by a fair margin. A surplus of $3,000,000 would mean earnings at the rate of about 17.7 per cent. against 15.9 per cent. the previous year, but the expectation is that the actual figures will show closer to 18 per cent.

A good many guesses have been made in the last week as to what the company's statement will show. Thus, it is stated that net earnings to the end of February, or for ten months of the company's year, showed an increase of $230,-636. Allowing the same rate of increase for the last two months, that would give a gain of approximately $291,000 for the year.

The steady reduction of fixed charges through the operation of the sinking funds, a reduction which it is believed will bring fixed charges to the lowest level since the Lachine Company was absorbed in 1904, naturally reacts favorably on the surplus available for dividends, and the increase here will be considerably larger than in net earnings.

DOMINION TRADE DECREASE.

REVISED trade figures for the past fiscal year and for the month of March last tell a story of steadily decreasing trade in the Dominion. While the figures for the fiscal year show an increase of $26,697,554 in the total trade of Canada, this growth falls short of being commensurate with that of previous years, the increase for the fiscal year ending March, 1913, being in the neighborhood of $218,000,000. It is evident also that but for the opening months of the past fiscal year there would have been a decrease in total trade instead of an increase. The total trade for March last, for instance, shows a falling off of twenty-three millions as compared with March of 1913.

The total trade of the Dominion for the past fiscal year is given at $1,073,-766,098, as compared with $1,047,068,544 for the preceding fiscal year. The total trade for March was $80,873,598, as compared with $103,555,778 for March, 1913. This is exclusive of coin and bullion.

An analysis of the figures for the fiscal year shows an increase in exports over the preceding year of $78,368,869, and a decrease in imports of $51,671,315, the total exports being $455,437,224, and the total imports being $618,328,874. For March alone there is a decrease of fifteen millions in imports and of eight millions in exports. It was stated by the Minister of Finance in the Budget that trade commenced to fall off during the month of October last, but that there was every prospect that the end of the downward movement had been reached. Mr. White's prediction is apparently not borne out by the March figures, which show a heavy decrease in both exports and imports.

An interesting commentary upon Hon. George E. Foster's search for wider markets for the Dominion in lieu of those offered to the South is found in the figures for the twelve months ending February last, during which the West Indies treaty recently consummated by the Minister was in force. Much was said of the possibilities of this market under the new agreement, and of the stimulation which Canadian trade was to receive from it; but the figures show that during the time the new treaty has been in force there has been a falling off in the total trade of Canada with the West Indies of $1,878,603. The total trade with the West Indies for the twelve months ending February was $9,094,625, as compared with $10,973,228 for the twelve months preceding.

Many Imports Declined.

The dropping off of Canadian imports during the twelve months occurs in a great many important commodities. Of breadstuffs Canada imported during that period nine million dollars' worth as against eleven million for the preceding period, or a decrease of two millions; of metals, minerals, etc., $155,000,000, as against $167,000,000, or a decrease of twelve millions: of iron and steel $124,-000,000, as against $135,000,000, or a decrease of eleven millions; of provisions ten millions as against twelve millions, or a decrease of two millions; of settlers' effects fourteen millions as against sixteen millions, or a decrease of two millions; of sugar and molasses seventeen millions as against twenty-one millions, or a decrease of four millions; of furs, skins, etc., four millions as against eight millions, or a decrease of four millions.

Stimulus of Underwood Tariff.

The effect of the Underwood tariff is strongly reflected in the export figures for the twelve months ending February last. The tremendous stimulus given to the animal export is shown by an increase of nearly seven millions over the preceding year, the total value of the animal exports for the twelve months being nine millions as against two and a half millions for the preceding period.

Of the total export of nine millions, over eight millions are accounted for by export to the United States. Cattle account for over seven millions of the total export of animals for the twelve months. The total export of breadstuffs for the twelve months was $172,000,000, as against $115,000,000 for the preceding twelve months, or an increase of fifty-seven millions. Of this increase, the export of barley accounts for four millions, the export of oats for nearly nine millions, the export of wheat for thirty-nine millions, and the export of flour for one million.

An increase is shown of nearly seven millions in the export of paper, of nearly half a million in the export of potatoes, of eleven millions in the export of seeds, and of one million in the export of wood pulp.

PUBLIC SERVICE CORPORATIONS.

REPORTS as to decline in business of industries and of contracting earnings are somewhat common. In regard, however, to Public Service Corporations there have been no similar complaints. In Canada practically every public service corporation has shown an increase in earnings and if not an increase there has been no appreciable diminution. The only exceptions are one or two small lines principally operated by municipalities. During the extreme depression of 1913 these corporations generally, have done well by their shareholders.

The Financial World has reviewed the reports of 286 of the leading companies of the United States for the fiscal year 1913, and the showing made by them will prove very gratifying to those who hold shares as well as to those interested in this particular field of enterprise.

The tabulated aggregated earnings reflect a healthful and normal increase in gross and net earnings, despite the fact that in other avenues of enterprise it has proven difficult to maintain earnings and profits up to a point where they would indicate no shrinkages as compared with the former year's business.

Gross earnings of these 286 companies for the year were $866,416,400, or $54,857,676 greater than a year ago. The percentage of increase was 6.76 per cent.; net earnings were $370,801,186, a gain of $19,492,267, or 5.55 per cent., and surplus after all allowances for fixed charges and dividends, was $81,113,567, a gain of $2,655,893, or 3.54 per cent.

During the year these 286 companies disbursed to investors in interest on bonds, including all other charges, $150,223,407, which was $10,787,446, or 7.73 per cent., more than a year ago, and in dividends there was paid $130,777,354, which amount was $5,881,041 greater than in 1912, or a gain of 4.72 per cent.

Progress Made.

From the above tabulation it is apparent that the public service corporations in every respect have forged ahead both in gross and net revenues and in the profits and interest they have been able to divide with those whose capital has made their financing possible and successful. While the surplus over all charges and dividends shows a smaller ratio of increase, this is due to the fact that during the year the 286 companies increased their bonded debt by $87,820,793, the charges on which absorbed profits and cut into the surplus account.

This increased indebtedness was incurred principally for improvements and extensions which have not yet had much of an opportunity to develop additional traffic and revenues, but when they get fairly into play they are expected to add proportionately to the revenues of the companies.

What should attract the most marked attention is the vast amount of capital which has been invested in this class of enterprises and which can be taken as a reliable index of the prominent position these companies occupy in the development of our country.

No stronger proof could be asked for or furnished to support the argument that, next to the steam railroads, the greatest volume of capital has flowed into public service enterprises. The fact that the business has steadily developed into larger proportions with each year has shown the wisdom of this form of investment.

Of all industries none has evidenced a better ability to withstand adversity than public service enterprises.

New Incorporations

The Canada Chain Co., Ltd., has been incorporated at Toronto, with a capital of $40,000, to manufacture chains, bolts, nuts, etc., at Sarnia, Ont. Incorporators—R. V. LeSueur, A. I. McKinley, N. LeSueur, of Sarnia.

The Capital Contractors, Ltd., has been incorporated at Toronto with a capital of $40,000 to carry on business as contractors at Ottawa. Incorporators—W. H. Craig, W. Y. Denison, E. F. Holcomb, of Ottawa.

The Davies & Newton Co., Ltd., has been incorporated at Toronto, with a capital of $40,000, to carry on the business of general contractors. Incorporators—A. H. Cox, W. E. Harries, A. V. Hall, of Toronto.

The Canada Lock Co., Ltd., has been incorporated at Toronto with a capital of $60,000 to manufacture all kinds of locks and hardware at Hamilton, Ont. Incorporators—W. Ballard, H. Carpenter, O. Hodson, of Hamilton.

The Brockville Paper Box Co., Ltd., has been incorporated at Toronto, with a capital of $10,000, to manufacture cardboard boxes at Brockville, Ont. Incorporators—A. T. Wilgress, E. J. Payson, H. A. Stewart, of Brockville.

The Standard Welding Co., Ltd., has been incorporated at Toronto with a capital of $3,000 to carry on an iron and steel welding business at Hamilton, Ont. Incorporators—W. Morrison, G. W. Ballard, H. Carpenter, of Hamilton.

The Ford-Smith Machine Co., Ltd., has been incorporated at Toronto with a capital of $100,000 to carry on business as engineers and machinists at Hamilton, Ont. Incorporators—P. Ford-Smith, O. L. Ford-Smith, A. Roberts, of Hamilton.

The St. Thomas Electrical Co., Ltd., has been incorporated at Toronto, with a capital of $40,000, to manufacture electrical appliances, etc., at Toronto. Incorporators—F. A. Youmans, B. W. Whitworth, J. T. Webster, of St. Thomas, Ont.

Atlantic Constructions, Ltd., has been incorporated at Fredericton, N.B., with a capital of $50,000 to carry on business as contractors at St. John, N. B. Incorporators, T. H. Gorman, E. M. Gorman and R. C. Gilmour, all of St. John.

Trade Gossip

The Canadian Bartlett Auto Co., Toronto, Ont., capitalized at $1,000,000, have just purchased from the H. L. Wood Co. the latter's new three-storey solid brick factory on Noble Street, which adjoints the railroad yards in Parkdale. The property has a frontage of 100 feet and a depth of 107 feet, and the price was about $35,000. The H. L. Wood Co. will erect a large five-storey factory on Queen Street. The Bartlett Co. will take over their new premises soon and commence the manufacture of their cars, which are of special construction in so far that there is a second framework besides the chassis. This framework rests on two smaller tires attached to the axle and partakes of the nature of a shock absorber.

Pulp Wood Purchase.—Mr. Duncan Chisholm, representing the Chisholm Corporations, Ltd., has entered into an agreement with the Provincial Government for the purchase of the pulp wood on the Metagami River pulp limit. Tenders for this limit were received until the 31st December last, but none of the offers were acted upon at the time because certain conditions were not considered satisfactory to the Government. One of the conditions of the tender is that the company shall install a pulp mill costing not less than $250,000 to handle seventy-five tons of pulp per day and employ not less than 200 hands on an average of ten months in the year. Crown timber dues of 40 cents per cord for spruce and 20 cents per cord for other woods are to be imposed; the Crown reserving a railway right-of-way, water powers and granted lands.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Brockville, Ont. — The municipal board of works has recommended the purchase of electric drills for getting out stone.

William Kennedy & Sons, Ltd., of Owen Sound Ont., are building an addition to their steel casting plant to cost about $6,000.

Toronto, Ont.—The Board of Education is buying for the Technical School three 15-in. motor-driven lathes, one 16-in drill press, some small tools, twist drills and tool steel.

Estevan, Sask.—A. S. Porter has submitted a proposition to supply the town with light and power. The franchise required covers a period of 25 years, the town to take $50,000 worth of stock and build a transformer station. Mr. Porter would furnish a bond of $100,000. A briquetting plant may also be installed.

Regina, Sask.—Enlargements to the plant of Whitworth Bros., at Pilot Butte have been decided upon. The extensions will involve an expenditure of from $50,000 to $100,000, and include a locomotive crane, and a complete new crushing and screening plant, the order for both of which has been recently placed with MacKenzie-Hazell Supply Co., of this city.

Fort William, Ont.—The Northern Engineering Co. of Fort William was the successful tenderer for the supply of two hundred tons of bolt and iron work to be delivered to the Port Arthur Construction Co. for work on the breakwater. The contract price for this supply represents an approximate figure of $10,000. The same company is also supplying one hundred and thirty-five tons of material for the Thunder Bay Construction Co. for breakwater purposes.

Nelson, B.C.—Efforts on the part of the Nelson Board of Trade and mining men of the district to induce the Wolsey McAlpine Johnson Zinc Corporation of New York to locate its proposed new electric zinc smelting plant at Nelson have resulted in the decision of Mr. Johnson, Dr. Struthers, his associate, and Dr. E. A. Barlow, of McGill University, Montreal, who has been working ion the problem for the Canadian Government, to visit Nelson and discuss the matter with the local people.

Vancouver, B.C.—The contract entered into between the Western Canada Trust Co., and Fleishacker Bros & Johnston of San Francisco, whereby the plant of the Ocean Falls Co., situated 200 miles north of Vancouver, is to pass under the control of a merger of the Pacific Coast Pulp and Paper interests, has been confirmed. The plant at Ocean Falls is one of the largest pulp plants on the coast, and is equipped with modern machinery for turning out 140 tons of dry pulp per day. The lumber mill has been in active operation for some time in connection with the company, but the largest feature of the company's enterprise was conceded to be in the pulp industry.

Electrical

Guelph, Ont.—The Provincial Hydro-Electric Commission have ordered a reduction of rates to be made. Work in connection with new transformer stations and transmission lines will be proceeded with.

Ayr, Ont.—A special meeting of the council took place on May 5, when the Hydro Commission representative, Mr. Wilson met the council and made preparations for the coming of hydro power. Mr. Wilson said that in all probability the line would reach Ayr about the first of August. A motion was made authorizing the purchase of a building for use as a transforming station.

Municipal

Kaslo, B.C. — The town have taken over the Kootenay Electric Co.'s power plant.

Fredericton, N.B.— The city council may buy a tarvia plant for paving several streets.

Medicine Hat, Alta.—A by-law for $70,000 to construct a subway at River street has been given its first and second reading.

Oshawa, Ont. — A fire alarm system may be installed. The tender of the Northern Electric Co. for $4,875, is being considered by the council.

Simcoe, Ont.—The town council has awarded the contract for the construction of a sewer system, to S. S. Harper & Sons, of St. Thomas, Ont. The price was $25,685.

Hamilton, Ont.—It is probable that a by-law will be voted on early in June to authorize the raising of $500,000 for the construction of the proposed east end sewage disposal system.

Edmonton, Alta.—It is probable that steps will be taken to establish a municipal paving plant in the city before very long. Already $35,000 has been appropriated for this purpose.

Vancouver, B.C.—Waterworks Engineer Breckon and Fire Chief Carlisle have recommended that new water mains be laid in the warehouse district and that a gasoline engine driven pump and a water tower be purchased.

Newmarket, Ont.— Notice was given at the meeting of the town council on May 4, of their intention to raise $25,000 by debentures for the extensions of the watermains and artesian wells in the municipality.

New Liskeard, Ont.—The Town Engineer has been instructed to make the necessary measurements for the ordering of a long steel pipe to replace the present iron pipes which carry the water supply across the river.

Stamford, Ont.—A waterworks system will be installed. Tenders are being called on standpipes of various capacities, up to 120,000 gallons. A contract for steel pipe has been placed with the Canadian Allis-Chalmers Co., Toronto.

Weyburn, Sask. — Money by-laws, amounting to $155,500, were unanimously indorsed by the ratepayers on May 5, and work will begin at once on the improvements concerned, which consist of sewers, water works, and electric plant.

Newmarket, Ont.—A by-law authorizing an issue of debentures amounting to $25,000 for the extension of the water service has been passed. The report of the Water and Light Committee regarding the artesian wells has been received and adopted.

Toronto, Ont.—The Board of Control in a private conference with the Harbor Commissioners on May 7, agreed to appropriate $1,500,000 towards the harbor development work. The funds will be supplied in instalments, as the work

Canadian Safety Engineering Bureau

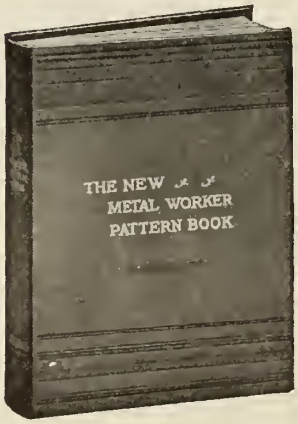
Let Us Be Your Eyes

Weekly or Monthly Inspections maee.

Members of our firm are Safety Engineers—and experts—trained in safety engineering work, with wide experience in United States and Canada.
Some of largest industrial concerns are our clients to-day. We have recently finished a safety first movement in plants of The Massey-Harris Co., Toronto, where many hundred danger points have been covered or removed.
We not only remove all present danger points, but coach and teach a committee of your employees.
No shop is too small for an accident to happen, with its consequent compensation. **Our service means real money saved to you**—it is preventing suffering and cripples and saving lives.

We can serve you in any of the following:—
Safety Engineering, Accident Prevention in Industrial Plants,
Safety Inspectors for Fire Prevention in Buildings,
Safety Protection for Boilers and Mines,
Electrical, Sanitary and Construction Work,
First Aid and Emergency Hospital Plans,
Consultations on Compensation Laws and Rates,
Cost Accounting for all Classes of Work.

Don't wait till an employee is maimed for like or killed. And in your own interests write us to-day for further information.



We shall be pleased to refer you to firms who have used our service.

The New Metal Worker Pattern Book

This is the most elaborate and complete work that has ever been brought out for the use of sheet metal pattern cutters. It is printed from new type with a new and improved arrangement, especially convenient for reference and study. Parts of a former edition, entitled The Metal Worker Pattern Book, which have been utilized in its preparation, have been re-written and simplified and later methods embodied. 218 problems are now given, 75 of which are entirely new. A Treatise on Pattern Cutting as applied to all Branches of Sheet Metal Work. By George W. Kittredge. 430 Pages; 744 illustrations; Size, 10 x 13 inches. Cloth bound, Price, $5.00. Sent postpaid only on receipt of price.

Technical Book Department

MacLean Publishing Co., Ltd.

143-149 University Ave., Toronto

is done, and itemized accounts received by the Board of Control.

Tottenham, Ont.—The town council has decided to spend $16,000 on a new waterworks system. The water is to be supplied from an artesian well, which has a 60,000-gallon capacity per day. The system itself is designed so as to provide a fire pressure of 100 pounds per square inch and a domestic pressure of 60 pounds. Tenders for pumping equipment and pipe have been received. E. A. James, of Toronto, is consulting engineer.

Guelph, Ont.—The annual report of the Light and Heat Commission of Guelph shows very satisfactory returns; and though the rates were reduced 5 per cent. at the begining of the year for power, residential and commercial lighting, with the increase of business that this reduction has effected, it is expected to make a further decrease in rates at the end of the year or earlier. The report shows that over twice as many electric services were installed in 1913 as in the previous year.

Wood Working

Toronto, Ont. — R. W. Burnaby has leased a site in Davisville and will erect a planing mill.

Limoilou, B.C.—A fire recently destroyed the box factory of the Turner Lumber & Pulp Co., entailing a loss estimated at about twenty thousand dollars. Arrangements have been made by Mr. A. J. Turner and Mr. Leander Conway, manager of the factory, with Mr. J. H. Gignac to carry on their box manufacturing business until the factory is rebuilt.

Englehart, Ont.—A company is being formed to purchase several thousand acres of timbered land near here with the intention of building and operating a large woodworking factory. Chairs, broom handles, door knobs, etc., are to be the products. American capital is thought to be back of this industry which expects to be well under way within the next year.

General Industrial

Galt, Ont.—M. C. Boulette, of Brockton, Mass., is opening a shoe factory here. The machinery is being installed.

Owen Sound, Ont. — The Canada Yeast Co. has asked exemption from taxation for ten years. They are to employ 25 hands.

Owen Sound, Ont. — The Union Cement Co. has asked the town council to submit a by-law guaranteeing their bonds for $60,000.

Owen Sound, Ont. — Thirty-five new mail and letter boxes are to be added to those already in use here, making a total of 57 in all for the town.

Winnipeg, Man.—It is reported that a beet sugar factory may be built here. Mr. Roland, Industrial Commissioner, is negotiating with a group of capitalists.

Port Arthur, Ont.—It is reported that a United States concern has set aside a sum of money for building a plant in Canada, and is considering locating here.

Brantford, Ont.—The Canada Glue Co. plant, situated about two miles from here, was totally destroyed by fire on May 9. The loss is estimated at $125,000, and is fully covered by insurance.

Winnipeg, Man. — The Lake of the Woods Milling Co. is negotiating for the purchase of the largest flour mill in Medicine Hat. The deal is expected to be closed this week.

Wiarton, Ont. — The Canada Casket Co. by-law was given the third reading by the Town Council on May 11, and next week the company will begin work on their plant here.

Florence, Ont. — An early morning blaze on May 4, destroyed the handle factory of Ira Webster of Rutherford. The building and stock were a complete loss.

St. John, N.B.—It is reported that W. Macdonald Mackintosh, formerly of Liverpool, England, will build a factory here to make waterproof cloth goods. The process is Mr. Mackintosh's own invention.

St. John, N.B.—W. U. Homfray, an English capitalist, states that representatives of three large British manufacturing concerns are in search of a site for the location of branch factories to handle their Canadian business.

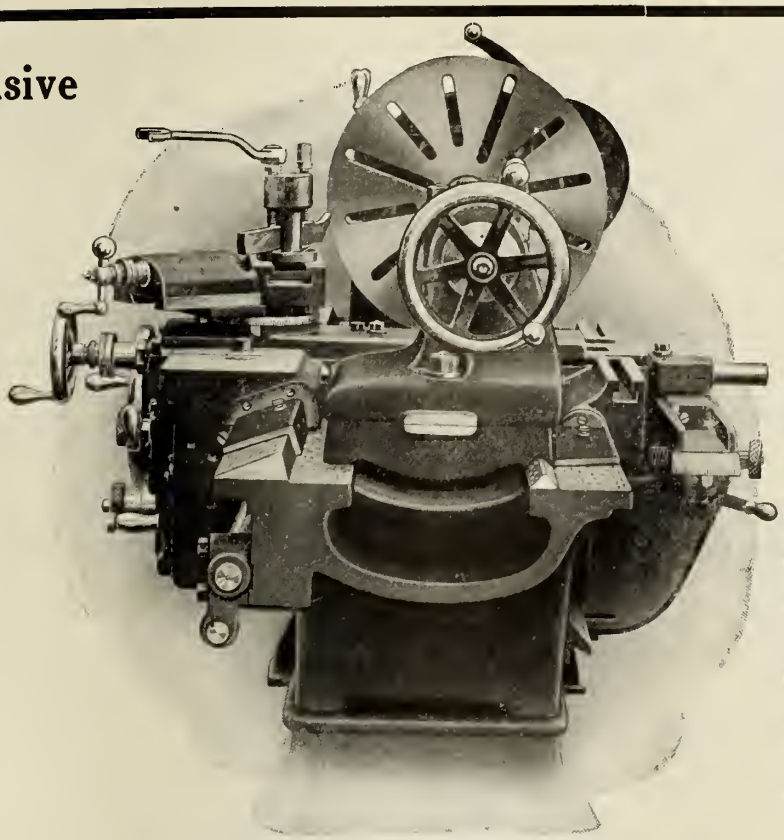
Kingston, Ont.—F. R. Phillips, manager of the Reliance Moulding Co., Ltd., states that the work on the foundations of the new factory will begin soon. The building will be 80 x 130 feet, two-storeys high. The machinery will be removed from the Toronto plant.

Brantford, Ont.—A company is being formed to establish a pressed brick plant here. The company has a capital of $200,000, and is composed of Toronto capitalists. John T. Jackson and Thomas Knight of Toronto, are interested.

Waterloo, Ont.—The ratepayers by a vote of 550 to 175 carried a by-law on May 4, to loan $50,000 to the Globe Furniture Co. The company agrees to erect two large additions to cost not less than $125,000, on which the town secures a first mortgage. Two hundred persons will be employed. The loan is for 10 years.

Woodbridge, Ont.—This town has already begun to feel the boom of Hydro power. Although the by-law has only been carried a few days, an American firm has purchased the old American Abel factory on the Humber river. The product of their factory will be films for moving picture machines.

Cobourg, Ont. — The ratepayers will vote upon a by-law to loan $10,000 to a felt factory promoted by Mr. Z. D. Charles of Montreal. The company is to employ fifty hands the first year, increasing in ten years to two hundred. The town will have as security a first mortgage on the plant.



Galt, Ont.—Preston is entertaining a proposition from the Building Product Co., makers of sand bricks and other building material. This concern offers to establish a $50,000 plant, employing 50 men. They have $20,000 of Toronto capital subscribed, and ask $15,000 stock subscribed locally and a loan of $15,000 from the town.

Montreal, Que.—A fire occurred May 5 in the factory of Sadler & Haworth, leather belting manufacturers. It was confined to the top floor and such loss as there was is fully covered by insurance. The main stock of belting was not harmed and orders are being filled as usual. The damage done to the building amounted to about $20,000.

Listowel, Ont.—The Town Council on May 4, provisionally passed a by-law authorizing a loan of $10,000 to the Dominion Milk and Flour Co. Mr. John Hodge of Brantford, is secretary, and Mr. Richard Thomson is president of the company. The by-law will be voted upon June 1. The company proposes to spend at the outset $35,000 in factory equipment for the manufacture of butter and milk powder.

Hamilton, Ont.—Regarding the erection of the plant of the Hamilton Bi-Product Coke Co., John G. Gauld, solicitor of the latter states that the present delay in connection with the negotiation was due to the indecision of the government over the harbor improvements near the site where the plant will be built. As soon as it is known what the Government will do regarding these improvements, work on the plant will go ahead.

ASSOCIATION AND PERSONAL

A Weekly Record of Current Association News and of Individuals
Who Have Been More or Less Prominent in Machinery Circles

Personal

Captain George Moulton has retired after 29 years' service with the Toronto Ferry Co.

James H. Plummer, president of the Dominion Steel Corporation, has gone to Sydney.

Robert W. de Forest has been elected a director of the Temple Iron Co. in place of the late George B. Baer.

John Graham Steacy, railway contractor, died at his home in Brockville, Ont., on May 8, at the age of 77.

G. H. Archibald, of St. Catharines, Ont., has been appointed city engineer of Saskatoon, Sask., to succeed Geo. T. Clark, resigned.

James Reid Wilson, president of the Thomas Robertson Co., Ltd., Montreal, died in London, England, on May 11, of pneumonia. Mr. Wilson was born in Glasgow, Scotland, in 1850, came to Canada when 21, and became associated with Robertson & Co.; in a few years becoming managing director. He was a director of several steel and other large industrial concerns.

A. B. Wilmott, a well-known mining engineer, died at his home in Toronto on May 8, aged 48. Mr. Wilmott was consulting engineer to the Lake Superior Mining Corporation and was in charge of several mines at Madoc, Ont.

The Central Railway and Engineering Club, Toronto, will hold a meeting at the Grand Union hotel on May 26, when Mr. Riley Schenck, manager of the Canadian Safety Engineering Bureau, Toronto, will deliver an address on "How and Why in Safety First."

William Harris, founder of the Harris Abattoir Co., died at his home in Toronto on May 11, aged 66. Mr. Harris, who was born in England, came to Canada 45 years ago. Fifteen years ago he founded the company with which his name is associated.

Captain R. O. Jones, for several years in command of the White Star-Dominion liner Canada, has been appointed to the Laurentic. Captain Ingham is now in command of the Canada, while Captain Mathias has been transferred from the Laurentic to the White Star liner Adriatic.

Captain Lindsay, it is reported, may be appointed chief of the Montreal and Quebec Corporation of Pilots. His position as Dominion Wreck Commissioner may be given to Captain L. A. Demers, while Captain Bourassa will likely be appointed harbor master of the port of Montreal.

The International Association of Steam and Operative Engineers have formed a branch in Medicine Hat, Alta. The following have already joined:—

WHO'S WHO.

MALCOLM R. MELDRUM,
Manager, Herbert Morris Crane & Hoist Co., Ltd., Toronto.

Alex. Higgins, Alfred J. Griffiths, C. Munroe, G. Foster, H. H. Banks, J. Wood, W. J. Smith, Walter P. Sinclair, W. Currie, G. Gleaves, R. McAffer, J. Rich, Edwin, Sinclair, James Williams, A. Webber, A. B. Chalupsky. W. J. Smith has been appointed secretary.

C. C. Mendham, who has been connected with the outdoor staff in Toronto of the Herbert Morris Crane and Hoist Co., Ltd., has now been appointed their manufactures to insnre prompt This appointment is in line with the company's well-known policy, which consists not only in carrying large stocks of their manufacturers to insnre prompt delivery, but in furnishing also a consulting engineering service which will advise on the best equipment for any given set of conditions.

Trade Gossip

The Perolin Co., of Canada, Toronto, have appointed Burroughs, Joyce & Co., 30 St. John Street, Montreal, agents for Quebec Province.

Scotia Steel Output.—The Nova Scotia Steel and Coal Co.'s output for April was as follows:—Ore mined, 48,771 tons; coal mined, 70,300 tons; steel ingots made, 6,250.

The Canadian Stewart Co. have brought a large hydraulic dredge from the Upper Lakes for work in Toronto harbor. The dredge has a capacity of 5,000 cubic yards of material per day.

Canadian Vickers, Ltd., of Montreal, have placed a contract with the Westinghouse Cooper Hewitt Co., Ltd., for the supply of silica lamps for the lighting of their shipbuilding yard at Maisonneuve, Que.

The C.P.R. steamer Empress of Asia, which arrived at Vancouver on May 3, lowered the record for the Yokohama-Victoria voyage by two hours, making the trip in 9 days 3 hours. The previous record was held by her sister ship, the Empress of Russia.

The Magnolia Metal Co., 113-115 Bank Street, New York, have requested us to state that they are issuing an interesting "War Map of Mexico," 14¾in. x 11in., which they will be pleased to send to our readers free of charge upon application, while the snpply lasts.

Gorman, Clancey & Grindley, Ltd., Edmonton, recently opened a new display room in the Cattistock Bnilding, Jasper Ave., where they carry sample lines of transmission equipment, pumps, gasoline engines, steam gauges, lubricators, etc.

The A. R. Williams Machinery Co., Toronto, have recently concluded arrangements for an exclusive agency with Joseph T. Ryerson & Sons, Chicago, Ill. The principal lines made by this company are spring shop equipments, combination punch and shears, portable railway tools and friction saws. Other lines handled by the A. R. Williams Machinery Co. will include the "Lennox" rotary bevel shears, serpentine shears and housing splitters. A complete line of sample machines will be carried in stock at the Lake Street works, where a motor-driven demonstration plant will be installed.

An inexpensive way to Fire-Proof your Plant

A fire cannot get any headway if your Plant is equipped with

Manufacturers' Automatic Sprinklers

Insurance rates drop about 80% when a Plant is protected with these Sprinklers. Why is it? Because you may be sure they are certain that there is practically no danger of a fire getting beyond control.

Manufacturers' Automatic Sprinklers **will pay for themselves in five years,** or less, with the saving effected in insurance rates.

How can you afford to be without them?

We would take pleasure in giving estimates on equipping your old or new Plant.

Manufacturers' Agents

We frequently receive inquiries from manufacturers of machinery specialties or supplies, asking us to suggest the names of reliable agents who might be interested.

For the benefit of Manufacturers' Agents who are subscribers to "Canadian Machinery," we maintain a bureau of information regarding agencies available.

We will be glad to hear from reliable agents desiring suitable lines, in order that we may put them in touch with enquiring manufacturers.

State lines you are specially interested in, and see if we can't connect you with something worth while.

Your name will be kept on file and you will be communicated with from time to time, as occasion arises.

Tenders

Toronto, Ont.—The date for receiving tenders on the 24-million gallon centrifugal pumps and engines has been extended from May 19 to June 16, 1914.

Saskatoon, Sask.—Tenders will be received up till May 30 for two 750-h.p. water tube boilers, two chain grate stokers, two sets economizers, and two sets superheaters. Plans and specifications may be obtained from E. Hanson, city electrical engineer.

Burnaby, B.C.—Tenders will be received by the undersigned up till June 1, 1914, for the supply of about ten miles of lap-welded steel water pipe. Copies of the specifications may be obtained at the Engineering Department, Municipal Hall, Edmonds. A. G. Moore, clerk.

Shoal Lake, Man.—Tenders addressed to F. Dobbs, secretary-treasurer, will be received until May 28 for equipment specified as follows:—Furnishing and installing semi-Diesel oil engine, furnishing and installing direct-current generator, booster and switchboard. Plans and specifications may be seen at the offices of the John Galt Engineering Co., Winnipeg.

Contracts Awarded

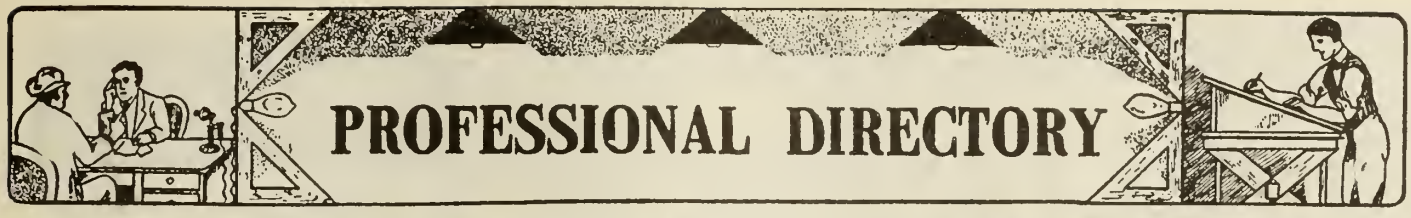
Swift Current, Sask. — The contract has been awarded to Gilstrom Brothers, for the construction of the power house at a cost of $21,000.

Winnipeg, Man. — The contract has been awarded to the Manitoba Bridge and Iron Works at a price of $7,200 for the new lower lift of shell of gas holder.

Regina, Sask.—The contract has been awarded by The Saskatchewan Gas Co. to the International Supply Co., of Medicine Hat, Alta., for the boring of ten gas wells at Regina at a cost of $200,000.

Revelstoke, B.C.—The city council, at a meeting held on May 4, made final awards on tenders for a civic water power plant additions, accepting a contract with Escher, Wyss & Co. to furnish a water turbine with 44-inch valve, delivery within four months, at $10,300, and accepting a contract with the Canadian Westinghouse Co. to furnish a generator, exciter, and switchboard, delivery within four months, at $6,993.

Fraser & Chalmers of Canada, Ltd., of Montreal, Que., have been awarded a contract by the Nova Scotia Steel and Coal Co., Ltd., for a 2,000-kilowatt steam turbine, direct connected to an alternator made by Vickers, Ltd., Switch gear and the complete condensing apparatus were also included in the order. This unit will be installed in the same building as the 750-k.w. mixed pressure turbine made by Fraser & Chalmers Co., and purchased by the Novia Scotia Steel and Coal Co. about two years ago.



Fort Qu'Appelle, Sask. — Contracts have been awarded as follows for the construction and equipment of the buildings for the Saskatchewan Sanitarium for Tuberculosis. The Parsons Construction Co., construction of buildings, $118,100; Connor Bros., Winnipeg, heating and plumbing, $27,855; Northwestern Electric Co., Regina, engines, generators, switch board, mechanical and electrical supplies, $11,112; Canadian Kellog Co. Winnipeg, radial brick chimney, $3,415; Stewart Machine Co., laundry machinery, $3,850; George E. Siebert, Winnipeg, refrigerator plant, $4,397; O. M. Smith, Winnipeg, water reservoir and pipe line, sewage disposal plant and sewers, $17,507.

Catalogues

Traveling Trolleys.—We have just received from the Herbert Morris Crane and Hoist Co., Toronto, a copy of their newly-issued Bulletin B5, which is entirely devoted to the various types of their traveling trolleys. The Morris trolleys are of many patterns to run either on a flat-bar track or on the lower flange of an ordinary steel I beam. Some of them are prepared for short straight runways, while others, containing suitable swivels, are flexible in a horizontal direction, and thus permit of the use of curves or "bends" in the track. The bulletin contains a great deal of practical information of immediate interest to all users of this kind of equipment. The illustrations, diagrams and tables of dimensions and prices are arranged in a handy and useful form.

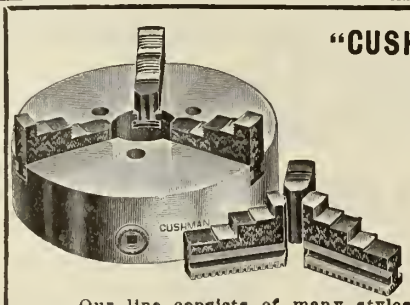
THE ROYAL CHUCK

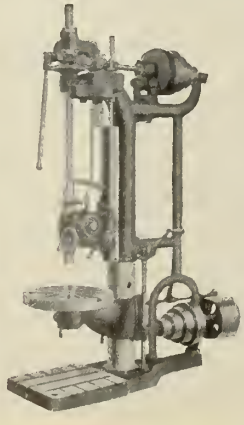


is made of the best material, and the workmanship is first-class. It has an extra heavy body and will stand hard usage. They are accurately milled and the parts well fitted.

We guarantee every one. For sale by all dealers or write

RAE BROTHERS
Manufacturers
HAMILTON CANADA

"CUSHMAN" CHUCKS



are generally known as the "heavy pattern," being designed for hard service.

Their accuracy and reliability have been proven over and over again, and the name "Cushman" on your chuck is a guarantee of satisfaction.

Our line consists of many styles and sizes of Lathe Chucks, Drill Chucks, Centering Chucks and Face-Plate Jaws.

Catalog Free

THE CUSHMAN CHUCK CO.
Hartford, Established 1862 Conn., U.S.A.

Let This
"Mechanic's Drill"

solve your drilling problems for you.
It has gone into the plants of many of our customers and done their drill press work so efficiently that at the first opportunity they've ordered more.
The "Mechanic's" is a straight forward drill press with lots of power to drive high speed drills up to the limit of their endurance. It may be had either with or without Tapping Attachment, and is made in a variety of sizes, both single and multiple spindle.

Agnew
Spot and Butt Welding MACHINES

Do the Work Rapidly and Economically

We are the pioneer builders of Electric Welders in Canada. If you do any quantity of welding or riveting you should investigate, at once, the merit of AGNEW Electric Welders. Let us study your welding problems and advance our ideas regarding your particular work.

Our machines are of the highest electrical efficiency, and we find by actual meter tests that they will in all cases do a given amount of work with less consumption of current than any other machine on the market.

We have good facilities for demonstrating these claims and the intending purchaser of electric-welding apparatus who expects to use a considerable amount of electric current should investigate this feature.

No. 21-D Spot Welder

will spot-weld from No. 30 to No. 10 sheet metal.
Depth of throat, 14 inches.
Adjustment of lower horn, 7 inches.
Water-cooled reversible points.
Height of dies from floor, 40 inches.
Floor space, 18 x 32 inches.
Transformer capacity, 15 K.W.
Operated either by foot-lever or belt power, leaving operator free to use both hands.
Speed 100 to 160 welds per minute.

No. 10-C Butt Welder

Capacity ¼ in. to ⅝ in. round, ¼ x 2 inches flat, stroke of movable carriage, 3 inches.
Adjustment of clamps, 1¼ inches.
Vertical adjustment of fixed carriage, ¾ inch above and below movable carriage.
Tilting adjustment of 10 degrees.
Transformer capacity, 10 K.W.
Height, floor to dies, 32 inches.
Will weld any length Butt or Tee.

Ask for catalogue. We are in position to build machines for any special work.

Keyseater and Slotter

Will cut keyseats, internal gears, internal ratchets, oil grooves, miscellaneous slotting, etc., more accurate and quicker than any machine on the market.

Baker Brothers, Toledo, Ohio.

Let the "Brazo-Hardening" Process Save Half Your Reamer Costs

The benefit accrues to you in this way. Our

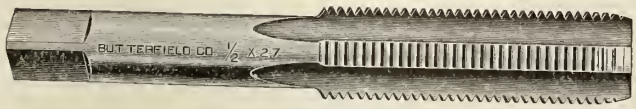
"PEERLESS" HIGH-SPEED REAMER

has blades of the finest quality, selected high speed steel, solidly joined by our patented "Brazo-hardening" process to a one piece soft steel body. We can thus provide durable cutting edges and a soft, tough supporting body at about half the cost of other high speed reamers.

"Peerless" Blades *never come loose* — a new reamer if they show evidence of such a defect. That's a liberal enough guarantee to make you interested in full details.

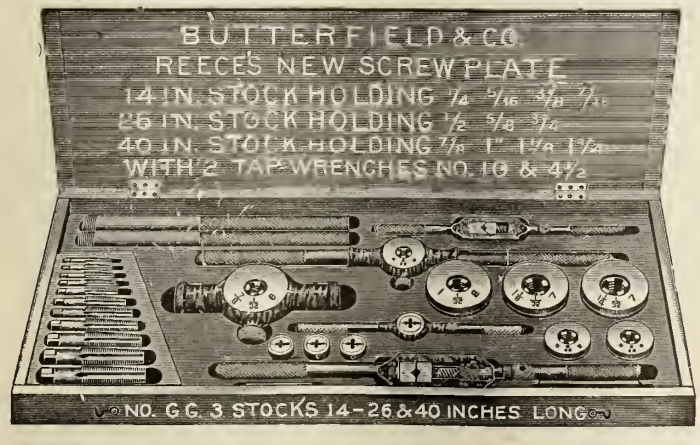
Ask for Catalog No. 36-C.

The Cleveland Twist Drill Co.



New York CLEVELAND, OHIO Chicago

Look for the name



"BUTTERFIELD"

It's Our Guarantee of Quality and Your Protection

Taps, Dies, Reamers and Screw Plates

You will do your plant justice by giving Butterfield tools a trial. We know that they are unrivalled and that they will increase the quality and quantity of your output, and give exceptionally long service.

They are the result of 35 years' practical experience.

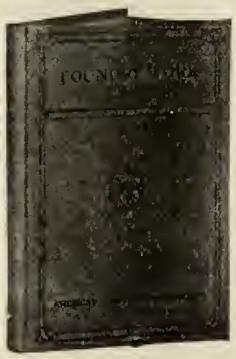
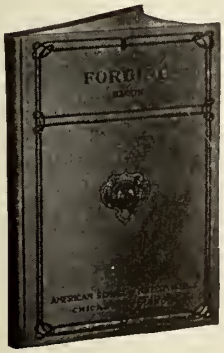
Mechanical Engineering Books



If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.

MACHINE-SHOP WORK. By Frederick W. Turner, instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price ...$1.50

MECHANICAL DRAWING. By Ervin Kenison, S.B., Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price **$1.00**



FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 142 illus. Cloth binding. A practical guide to modern methods of moulding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables etc. Price $1.00

PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price $1.00

MACHINE DESIGN. By Charles L. Griffin, S.B., Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price $1.50

FORGING. By John Lord Bacon, Eng. and Supt. of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price $1.00

TOOL MAKING. By Edward R. Markham, Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers. Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels —anuealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price **$1.50**

Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers, Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.

LAFFITTE

WELDING PLATES

A SCIENTIFIC CHEMICAL WELDING COMPOUND. WELDS IRON AND STEEL AT A REMARKABLY LOW HEAT.

You are not taking our products seriously enough; unless your blacksmith asks for it you never give it a thought. We can easily reach the smaller man who must consider every economy, but we cannot get at the man in your shop.

The larger you are the more you need LAFFITTE.

Let us send you samples. There are endless economies you can effect, and the cost is insignificant compared with the results.

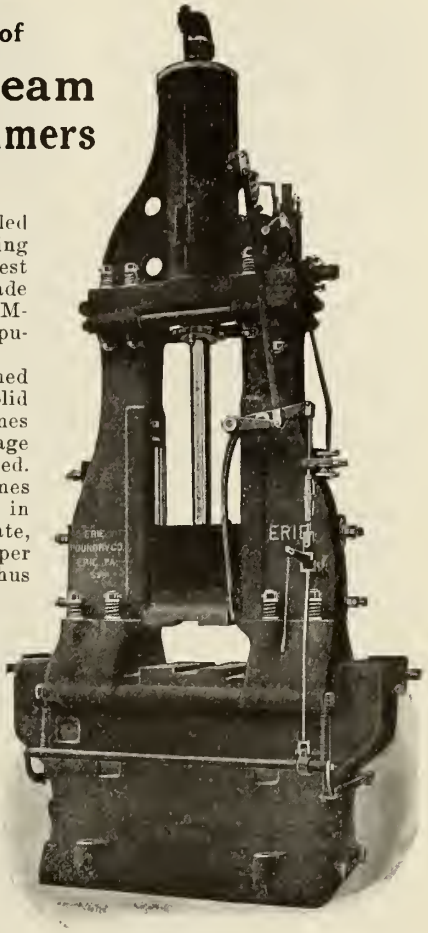
DEALERS THROUGHOUT CANADA HANDLE LAFFITTE

The Phillips-Laffitte Co.

Penna. Bldg., Philadelphia, U.S.A.

ASK FOR AND GET LAFFITTE

The construction of



"Erie" Steam Drop Hammers

is different.

That difference, coupled with sound engineering ability and the very best of materials, has made for "ERIE" HAMMERS an enviable reputation.

The Guides are designed so that they have a solid backing in the Frames the full length. Breakage is positively eliminated. The Cylinder and Frames are securely held in place by a steel tie plate, making the entire upper works as a unit, thus assuring accurate forgings.

Would you like to know other strong points of the "ERIE" construction? Send for catalogs.

Erie Foundry Company

Erie, Pennsylvania

Forty-Five Chances to Thirteen

Surely, conservative foundrymen can see which way is the profit.

In a Cupola thirty-six inches in diameter, when lined with Fire Brick there are forty-five joints where Fire Clay can fall out and fire can get in which means frequent repair bills to pay.

When **Stevens' Cupola Blocks** are used for the same lining, there are only thirteen joints—the least number possible.

The smoother the inside surface, the less abrasion wear; the fewer the joints, the smoother the surface.

Everything in favor of the block and of this block for it is made of the toughest materials obtainable. They can't be beat for standing heat.

Mixed carloads shipped of blocks, fire brick and fire clay, if desired.

WOOD SCREW MACHINES

Cable Address:
Cook, Hartford, U.S.A.

Asa S. Cook Co.

Hartford,
Conn.

High-Speed Steam-Hydraulic Forging Presses

Double your production with one-half your labor cost and steam consumption Cost of repairs reduced. Eliminates heavy shocks and vibration.

"SINGLE LEVER CONTROL"

Small sizes—single-frame type. Large sizes—four-column type.
Built for doing all classes of forging, shearing or pressing

100 Tons to 12,000 Tons Capacity

UNITED ENGINEERING & FOUNDRY CO.

2305 Farmers Bank Building, PITTSBURG, PA

EXCLUSIVE MANUFACTURERS FOR UNITED STATES, CANADA AND MEXICO
Manufactured under Davy Bros., Ltd., Patents.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

CANADIAN MALLEABLE IRON CO. LTD.
OWEN SOUND, ONT.

CASTINGS

ALL CASTINGS GUARANTEED TO YOUR APPROVAL

The "No-Wear" Nozzle

An exclusive feature of the
"Sly" and Satisfaction

And there are many other features that make

"SLY" SAND BLAST MILLS

the last word in equipment of this kind.

HERE ARE A FEW OF THEM:

Massive and solid construction, with large wearing surfaces. Barrel of steel plate 1 in. thick. Sand and dust are thoroughly separated. Blasting sand is automatically returned to the nozzle for continued use.

Perfect balance of the machine makes 1 or 2 H.P. sufficient for operation.

Machine can be adjusted without stopping.

We will be pleased to get you in touch with users, so that you can profit by their experience.

Ask for full particulars.

The W. W. Sly Mfg. Co.

CLEVELAND, OHIO

Complete Sand Blast Rooms and Equipment a Specialty

The advertiser would like to know where you saw his advertisement—tell him.

FIRE!

Where would you stand if your plant took fire? Have you provided ample means of exit for your employees?

We have installed modern fire escapes for many of Canada's largest shops. We would be glad to submit you plans and estimates. All work done according to Government Standard Specifications.

Forethought now may save you anguish and damages later. Act!

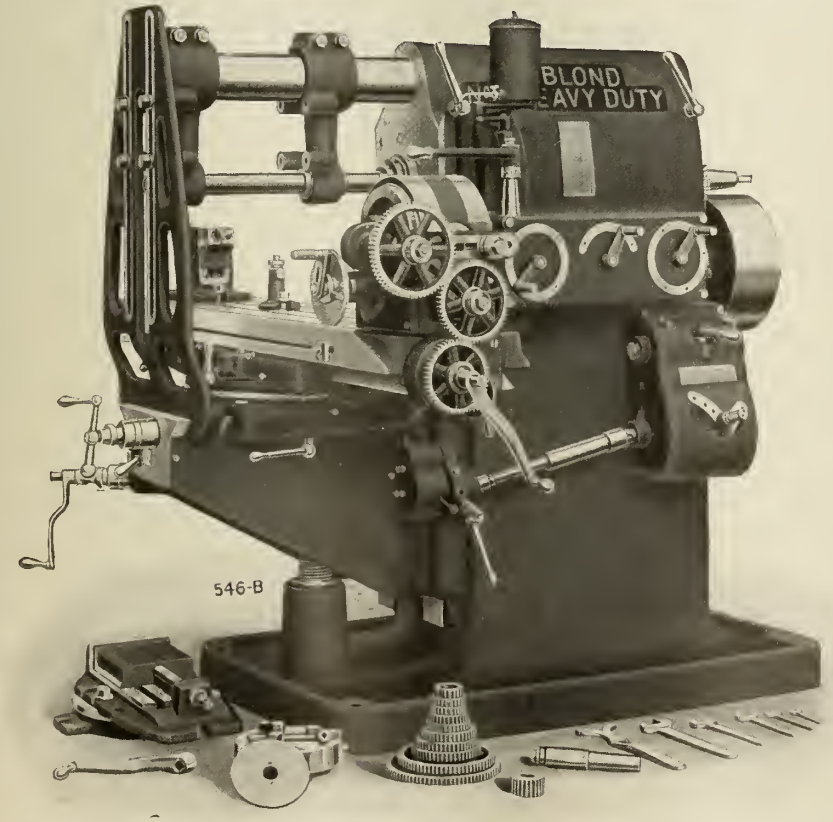
McDougall Gap Lathes

—

Strength
Accuracy
Quality



Take a look at the next money you intend to invest in a Lathe.
Then, take a look at the money's worth we offer you in our machine.
Your money will soon come back to you in increased production and we will have the pleasure of having a satisfied user. Our machines are just as good as they look and they look good too.
We invite the closest inspection.

Particulars on request.

ARE-MAC-DEE IS A GUARANTEE

The R. McDougall Company Limited
Manufacturers
GALT, Ont., Canada
The Canadian Fairbanks-Morse Co., Limited, Sales Agents.

LeBlond

Heavy-Duty All-Geared Milling Machines

Have Many Exclusive Points of Merit.

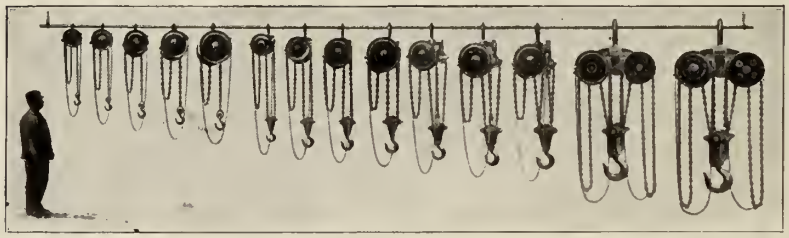
Among them are:

Hardened Steel Spindle Bearings. Nickel Steel, Heat-treated Driving Gears.

The most rigid knee section used on any milling machine.

A right-handed system of control, enabling the operator to secure a bigger output with the least possible exertion.

Catalog sent on request.



The R. K. LeBlond Machine Tool Co., Cincinnati, O., U.S.A.
Canadian Agents: The A. R. WILLIAMS MACHINERY CO., Toronto, Montreal, Winnipeg.

DON'T PUT THREE MEN

ON A JOB WHEN ONE CAN DO IT ALONE.

If It's A Hoisting Job
He Can Do It With A

READING MULTIPLE GEAR CHAIN BLOCK

It takes three men with a differential block, or two men with a screw block, to do one man's work with a Reading Multiple Gear Chain Block.

Compare a Reading Block with any Block and be convinced that it enables your men to do more work.

Vertical Shaper, Most Useful Tool of its Type

Distinctive Features Give Wide Range of Utility. Can Always Be Kept Supplied with Work

The P. & W. Vertical Shaper will handle the regular line of both slotting machine and horizontal shaper work and is more accurate and adaptable than either of these machines. Furthermore, for finishing dies and machining radial and irregular shapes, it is absolutely in a class by itself.

Built in two sizes—6" and 10"

Efficient on Shaper and Slotter Jobs

Swiveling Ram Head enables tool to be set in most advantageous position, also all sides of work can be machined at one setting. In case of two parallel sides, accuracy of parallelism is absolutely assured.

One of the most distinctive features of the Vertical Shaper is the tilting ram bearing. This permits the tool to cut at an angle from the vertical and hence the desired clearance can be readily obtained.

Another advantage of the Vertical Shaper on die work is that when working to a line, the cutting tool always enters the piece where the line is scratched. Thus the line can be accurately followed. Furthermore, this shaper is a precision tool and accuracy, which is highly important in the die work, is assured.

Unexcelled for Die Work

Write for new illustrated 12-page circular "Vertical Shapers."

Milwaukee Millers

The Choice of the Superintendent

The Superintendent is responsible for results from men and machines. If the men don't produce, he fires them. But he can't fire a machine without losing a good amount of money.

Considering the care and thought which the Superintendent must give to the selection of a machine, it is important to know the reasons why most Superintendents choose Milwaukee Millers.

Column. Box-section, semi-steel casting, deep, rigid and heavily ribbed. Openings as few and as small as possible.

Knee. Box-section, semi-steel casting with solid top. No slots or holes to spring or close when cutting strains or clamping strains are applied.

Table. Semi-steel, amply proportioned and finished on both sides.

Double Over-Arm. A patented Milwaukee feature which makes for greater rigidity and provides for a positive alignment of the arbors.

Arm Braces. Light, conveniently applied.

Flanged Spindle. Another patented Milwaukee feature. Prevents collars and cutters from giving trouble when being removed from the spindle; permits running of cutters either right or left-hand, and shields the end of the spindle.

Cascade Lubrication. A patented Milwaukee feature. A gallon of oil per minute cascades through open grooves over gears and bearings in the machine, lubricating and flushing away all substances that might cause scoring and heating.

Cutter Lubrication. Furnished with all Milwaukee Millers. Patented. An essential when working in steel.

Constant Speed Drive. We are the only milling machine builders who build this type of machine exclusively. All gears in speed (and feed) arrangement are of hardened steel. The constant speed drive gives maximum results at all times, irrespective of speed or size of cutter.

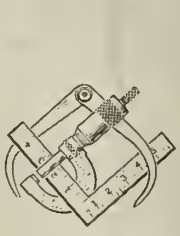
Speeds. 18 changes obtained with 10 gears. Changes in geometrical progression with a ratio of approximately 1.25 to 1. Easily accessible and computable.

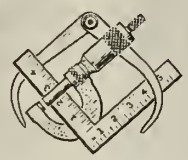
Feeds. 12 changes in geometrical progression with ratio of approximately 1.35 to 1. Minimum ½" per minute. Maximum 16" per minute. No two feeds can be accidentally placed in operation at one time.

Convenience. The number of levers has been reduced to a minimum. All operating levers are placed convenient to one operating position. Careful provision made throughout for adjustment to wear. No countershaft required.

Attachments. All attachments for Milwaukee Millers are as well designed and well made as the machine itself. They include — Vertical Spindle attachment, Universal Milling attachment, Slotting attachment, Dividing centers, Rotary table, Rack-cutting attachment.

This is a very brief summary of the manifold advantages of Milwaukee Millers. A much better idea can be had by getting our Bulletins. Better still, ask the Superintendent of any shop now using our machines.





Write for our complete Bulletins. We will send them to you immediately and also put your name on the list for a copy of the Kearney & Trecker Catalog No. 19, which will be ready about June 1.

We are pleased to have you consult us on any milling problem.

$58 OPENS THE WAY FOR FULL AUTOMATIC MACHINERY

Our Open Back Power Bench Press No. 201 has been reduced to the very elementals of flexibility in equipment. Either Single or Double-Action Presses can be supplied.

The Plain Press can be purchased—as illustrated, to be fastened to a bench. Or a complete Press with Iron Table and Legs can be ordered. The Table can be ordered with the Press or it can be ordered at any time in the future. Both Press and Table are standardized.

A Back Roll Feed can be ordered with the Press or it can be ordered whenever requirements make it necessary. This Feed takes the metal from a reel and automatically draws it under the tool ready to be operated upon. It feeds in either direction, front to back or back to front, and by adjustment moves the metal forward any predetermined distance at each operation. There is no chance of accident when this attachment is applied as it takes away the necessity of hand operation and makes the Press a Full Automatic Labor Saving Machine.

A Side Roll Feed can be ordered with the Press or at any future time. This takes the metal from a reel in a similar manner to Back Roll Feed, but being attached to side of Press feeds the metal across the bed from right to left or left to right as may be desired. It allows of greater operating space for tools as the metal travels across the greatest width of bed and punch block. Rolls can be adjusted in relation to bed of press.

A Transfer and Automatic Stop Attachment can be ordered with Press or at some later date. This is used in connection with Back Roll Feed. After Press has reached the limit of operation under regular equipment the Transfer carriers or transfers the blank into position for one more operation. It allows one additional operation without rehandling to what would be possible without such attachment.

A Dial Attachment may be ordered with the Press or at any future time. A Dial Attachment will handle small partly finished objects with speed where it would be both dangerous and slow to feed directly to the tool by hand. Lift Pin for Dial and other variations of attachments making them suitable for particular purposes can be fitted.

Bulletin No. 201 gives Full Details and can be had for the asking.

Butterfield & Co.

ROCK ISLAND, QUE. DERBY LINE, VT.

"Service First" as applied to Fairbanks-Morse Induction Motors

The rotating part of an induction motor is built like a squirrel cage, the ends of the horizontal bars being joined together by copper rings.

The first and simplest form of connecting the bars with the rings was by means of steel bolts, screws or rivets, and sad experience proved the faults of this construction.

Heavy starting currents naturally developed considerable heat. The resulting unequal expansion of the steel, different metals forming the joint, caused it to open and produce severe arcing with ultimate destruction of the joint. The gradual development of this condition decreased the efficiency of the motor and finally resulted in a general breakdown requiring extensive repairs.

The soldered end-ring construction which followed met the same fate. The inherent ability of a good electric motor to develop power greatly in excess of its rating with its consequent heating, brought out the limitations of this method. The solder would throw out.

It was in searching for something better that the "Cast-on" end-ring construction as applied in its most approved form to Fairbanks-Morse Induction Motors, was conceived.

This consists in actually fusing the ends of the copper rotor bars into an end-ring of a special composition, thereby producing a perfect electrical and mechanical joint. In this process the rotor, with its bars in place, is put into a mold (see illustration) and the red-hot molten metal poured around the bar, melting their ends and effectually fusing them into the body of the ring. The ring is then turned down to finished size and polished.

As this metal is fused to the bars at a temperature in excess of 1,000 degrees centrigrade, it is readily seen that the destruction effect of any subsequent heating is entirely eliminated.

Having no bolts, nuts or washers to break or become loose, no solder to melt and throw out, and yet having the metals in most intimate contact, makes this the one perfect and indestructible joint that designers have sought for so long.

Other details described in Bulletin 202H. The thousands of Fairbanks-Morse Motors in use to-day is a sufficient guarantee of their excellence.

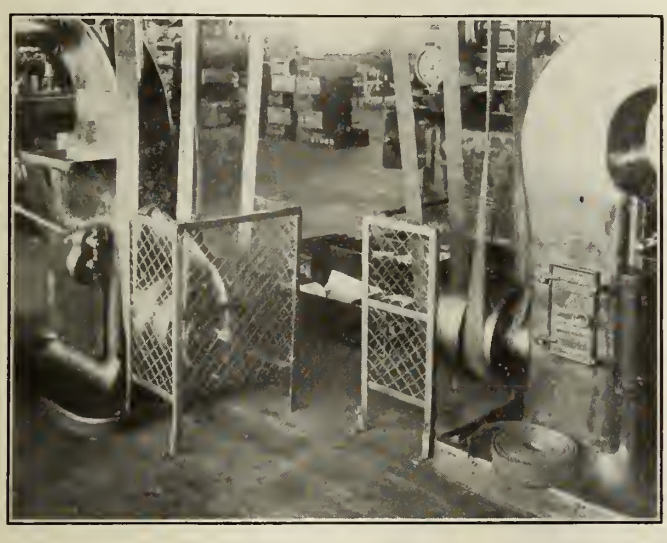
Burroughs Adding Machine Co. and "Safety First" Work

By C.T.R.

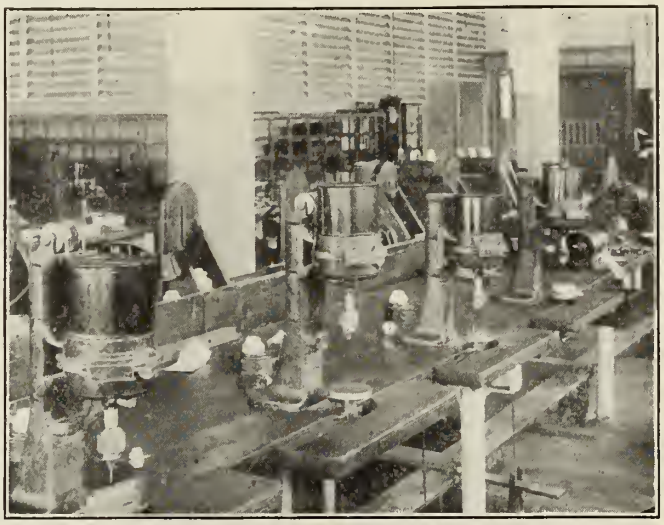
The Safety Movement has of late become so prominent and popular that every progressive individual and business enterprise is making some effort along certain of the lines embraced in its almost unlimited scope. Again, results surprising as well as stupendous have already proved its efficacy.

AT a recent meeting of the "Safety First" committee of the Burroughs Adding Machine Co., Mr. A. Brain, a member of the factory executive committee, gave a very interesting and instructive talk to the foremen and assistants on the "safety first" movement. He said in part:—



"Safety work must not be confused with the compensation law, for while the latter has no doubt to some extent introduced or advanced the safety movement, as far as we are concerned there need be no connection.

"The safety problem was no doubt given its greatest prominence by the accident prevention and relief report of Mr. Schwedtman and Mr. Emery, who in 1911 were authorized by the National Association of Manufacturers to visit Europe for the purpose of personally observing the operation of the prevailing systems of compensation for and prevention of accidents. The complete and thorough report made by these two gentlemen has, I am sure, been responsible in so many ways for the safety movement and many of the safety laws now in existence. European countries are far in advance on these subjects, but we believe that if we can let you understand what we are trying to do, we will have no trouble in securing your co-operation in seeking to remedy the unfavorable relative standing of this northern and western hemisphere.



Organization Object.

"The object of our safety organization is to prevent injury and accidents both in the factory and outside through the education of employee to the necessity of doing his work in a safe manner and thereby reducing his chances of injury and making him better able to take care of his family and those dependent upon him for support.

"To promote this work effectively, we must have some definite plan of organization. In small plants this is not necessary, because of their being in closer touch with the employees and the advantages of co-operation by individual method. We realize that we have grown too large to follow this method and that some organization is necessary in order to educate our workmen and carry on the work as it should be done.

VERTICAL BELT GUARDS.
Made of wire screen of strong construction and raised from the floor so as not to interfere with cleaning operations.

GUARDS ON MOTOR-DRIVEN MACHINES.
To prevent female operators' hair becoming entangled and wound up on revolving spindle or motor armature.

PHOTOGRAPH SHOWS A BAD PRACTICE.
One workman removing a foreign particle fro m another man's eye. The company provides a well-equipped First Aid Department, wh ere injuries of this kind can receive better attention; also this workman did not w ear the goggles which are provided for employees when working wher e chips and sparks may fly.

Individual Comparisons.

"European countries, particularly Germany and England, are far in advance of us on this subject, and it would at first appear that all we have to do is to copy the policy of the older countries to effect the same result; but a closer study will show that we cannot do this for several reasons. One reason given is that Germans, owing probably to their thorough military training, have greater respect for rules and regulations. If a notice or rule is posted in Germany it is strictly followed. In America it may mean nothing. We have a large foreign population of various nationalities that make the problem more difficult. Also, American workmen are not like German workmen, and we do not wish them to be in all respects. While we can learn much from European countries, it is up to us to solve the problem in our own way.

"The workman should be led to appreciate that employers are doing their part of safety work in making and installing safety equipment, and should be shown that he alone can accomplish the greater part of this safety work by practising careful habits to protect himself and his fellow-workmen.

"Fifteen per cent. of all accidents can be prevented by safety equipment.

"Fifty per cent. can be prevented by education and co-operation of workmen.

"Get the safety habit. Talk safety as you do baseball or other popular topics, not only in the factory, but in your homes.

"Use the safety match. Any workman who carries the common match on his person or uses it in his home is not educated in the safety movement.

"Mr. Schwedtman says—Killed and wounded in ten years through two wars —Spanish and Philippine—6,000 men. In the same time we have killed or wounded five million men in industrial work.

"Every workman should be carefully instructed and cautioned with regard to the dangers of his job, for all the safety devices we can install, all the rules we can formulate, all the safety designs we can post, will have but little effect unless we can prevail upon the workman to take a personal interest in his safety and that of his fellow-workman.

"We must by education overcome the workmen's objection to safety equipment, and teach him it is not cowardly to be careful, but that it is foolhardy to take chances.

"Neglect of small injuries frequently result in blood poisoning. A First Aid Department has been provided for the injured, and workmen should be taught not to neglect an injury, however slight.

"Lastly, when our people are thoroughly in earnest, when our enthusiasm has been aroused, and when our efforts become general, the safety problem will be solved, and better than it has yet been solved by European countries."

Mr. Brain illustrated his talk with lantern slides, showing how carelessness of workmen causes accidents and how careful habits will avoid accidents.

SIMPLE BUT NOVEL AND EFFECTIVE LEATHER GUARD.

Covering opening in rail of gate. This guard prevents finger or hand from entering into opening in rail when gate is opened, and which might cause painful injury.

HOLLOW METAL RODS.

THE uses to which hollow steel rods and bars can be applied in nearly every branch of mechanical engineering, says The Engineer, are so numerous and the advantages they present over solid rods are so obvious, both on the ground of saving of weight and for lubricating purposes, that if it were not for the cost of drilling there is no doubt their employment would be greatly extended. As most of our readers are, however, probably aware, the drilling of long parallel holes through steel rods is an expensive and tedious undertaking and is, moreover, frequently accompanied by disaster to the tool.

A patented process has been introduced by the firm of Dunford & Elliott (Sheffield), Ltd., whereby hollow steel bars of from about ¾ in. to 3 in. diameter and up to 20 ft. long can be produced by rolling from a drilled billet. After being drilled right through to the requisite diameter, the hole in the billet is packed tightly with a special kind of sand, which is capable of resisting the high temperatures used in the rolling process. The hole is next plugged firmly at each end by metal plugs, heated to the necessary temperature, and submitted to repeated rolling operations until a bar of the requisite dimensions and section is produced. In the rolling process, the packing material acts as a fluid or elastic mandril and maintains a hole right through the bar. The hole is approximately round and its size will, of course, bear some relationship to the length of the finished bar and the size of the original hole in the billet.

After being thus elongated, the core of packing material is removed by means of a special process, and with this object an apparatus has ben devised whereby the cost of production enables the makers to place the bars on the market at reasonable prices.

The bars produced by this process have already been extensively adopted in several branches of engineering work, and particularly for mining drills on the Rand, where the dust question is of vital importance. By the use of the hollow steel bar, a jet of water is introduced to the cutting edge, the dust is thus laid, the cutting edge is kept clear, and the efficiency of the drill greatly increased. For hollow shafting and spindles for machine tools, motor cars, textile machinery, etc., numerous applications of the hollow bars suggest themselves.

In cases where great accuracy is required, the hole formed by this process would, it is claimed, serve as a pilot hole for subsequent drilling operations, and in this respect alone would effect an economy both in labor and drills.

Standardizing Motors for Machine Tool Drives *

By Charles Fair **

The importance of motor-driven tools has now reached such proportions as to warrant serious consideration being given and definite steps taken to secure at least some measure of standardization mutually acceptable to the various interests concerned.

THIS paper is not written so much with the idea actually of settling at this time the question of standardization of motor dimensions and speeds for machine tools, as it is with the idea of pointing out a method which if followed should accomplish much toward the standardization desired. Certain of the dimensions and speeds once standardized will result beneficially not only to the machine manufacturer but to the motor manufacturer and to the machine user as well.

There will, of course, always be demands for odd combinations of speeds and requirements, and these it would be useless to attempt to standardize, but by far the majority of cases could be standardized under a heading that for convenience might be known as normal, and our efforts should be bent toward standardizing these speeds and dimensions.

For years and under generally adverse circumstances, much progress has been made in standardizing certain machine parts. For a long time it has been recognized as desirable, at least on the part of a number of machine tool builders, that something be done toward standardizing certain motor dimensions, speeds, etc., for machine tool drives. During the past five or six years attempts have been made to standardize certain dimensions and speeds for machine tool motors, but these attempts have failed for various reasons.

It would be of little use to analyze those past failures. Unquestionably there should be first of all a better understanding on the part of the machine manufacturer and the motor manufacturer of each other's difficulties, and much work is essential before material progress along the line of standardization can be accomplished.

It cannot be expected that the electrical manufacturers would change existing standards of motor dimensions or speeds, nor do I believe it would be either desirable or practicable to do so on account of the confusion that would result, but I see no reason why, if the machine manufacturer in conjunction with the motor manufacturer, will give the subject the consideration it warrants, and do their part toward bringing about a better understanding of what is really desirable in the way of speeds and dimensions, why the motor manufacturer in turn cannot incorporate, at least in part, some of the dimensions and the speeds when bringing out new lines of motors.

Obviously it would be just as impossible for the various motor manufacturers to design their motors to a single set of dimensions as it would be for the machine manufacturers to design their machines to a single set of dimensions. Notwithstanding this, however, much can be done to improve the situation. The American Society of Mechanical Engineers through its secretary, Mr. Rice, has offered to co-operate.

For the sake of convenience I have outlined five parts—namely, speeds, shafts, frame, method of drive and general.

Speeds of Motors.

There is an almost endless number of constant, adjustable and variable speed combinations available, but from this great variety certain speeds should become the logical ones for the majority of drives. The direct-current, constant-speed shunt motor speed, for instance, should logically be that of the alternating current, 60-cycle motor. Alternating-current and direct-current motor speed should be given in terms of full load or else in terms of both no load and full load. It is, of course, understood that the cycles fix the alternating current speeds, except as modified by slip, etc. Adjustable speed motors would naturally be higher in speed on the highest speed than a constant speed motor, because the adjustable speed motors were only run a certain percentage of the time at high speed. Adjustable speed motors are nearly always geared, and their speeds should be governed by a proper gear speed.

There should be little difficulty in arriving at a set of suitable speeds per horse power to be known as standards for both constant and adjustable speed motors after properly considering the items as set forth in the outline.

Shafts, Frame and Drive.

Obviously there should be little difficulty in arriving at a proper shaft diameter and key for a given horse power and speed motor. The length of shaft might offer some difficulty, but a compromise length could probably be agreed upon. Special shaft extensions and double shaft extensions, whether for hand wheel or power transmission should be considered.

A uniformity of dimension under the heading "frame" is obviously impossible, but much can be done to reduce the large variety of dimensions to perhaps two or three sets of dimensions per frame, instead of the dozen dimensions now existing. There is, of course, no reason why there should not be a uniformity in the size of the holes drilled in the motor feet per frame.

It is not only important but absolutely necessary to consider seriously the items under the head "drive" in order to arrive at some basis upon which properly to determine the best speeds, shaft dimensions, etc., to standardize; and here we should consider such subjects as diameter of motor versus length, minimum speed versus size and cost, maximum variation for adjustable speed motor and its relationship to minimum speed, cost and size and motor.

Uniformity of making motor terminals, wiring diagrams, protecting live parts, etc., are also of advantage to all concerned.

The importance of the motor-driven machine tool with relation to production has become such that the method of applying the motor to the tool in my opinion warrants far more attention than has been given to it in the past by some of the tool manufacturers, and I trust that before another year elapses that the motor manufacturer and the machine manufacturer will each have a better understanding of the difficulties of the other, and that much will have been accomplished toward the establishing of suitable standards.

*From a paper read before the National Machine Tool Builders' Association at Worcester, Mass., on April 23.

**General Electric Co., Schenectady, N.Y.

ECONOMY IN THE PRODUCTION OF GROUND SHAFTS.

By J. C. Spence.

AN investigation was recently made into the most economical method of producing ground shafts 62¼ in. long by 1.5605 in.-1.5615 in. diameter. The material was open hearth machinery steel, 0.35 per cent. carbon, 1⅝ in. in diameter. It was determined to turn one-half of the shafts to a size that would allow the grinding machine to "clean out" all of the turning tool marks without being too "fussy" about straightening the shaft, after the turning operation. The other half of the lot was ground directly from the black stock without any lathe operation.

The first half lot was turned .020 in. to .025 in. oversize at a cutting speed of 95 ft. per minute and a feed of 1-40 inch per revolution of the work. The cutting time was 11½ mins. per shaft, while the total lathe time, including handling, was 14 mins. The shafts were

then ground to the given size in 21½ mins. This gave a total time of 35½ mins. The other half of the lot, ground from the black, required 30¾ mins. each, to grind them to the given diameter.

The time for straightening these shafts has ben omitted because it is such a variable quantity. However, it is a much greater item after the turning operation than after the rough grinding operation (it being customary to rough-grind a lot of shafts and then to finish grind. This is due to the fact that in the turning operation, the lathe tool removes the stock in one cut thus releasing, at once, all of the strains set up in the outer shell, by the rolling operation, at the steel mill. This causes the bar to spring "out of true" to the greatest possible extent. On the other hand, the wheel cuts only a thin outer shell at each pass, and the amount of spring is correspondingly small. The next pass of the wheel cuts off the eccentricity caused by the previous pass but not necessarily adding to the eccentricity.

No Need for Springing in Grinding Machine.

Given the proper wheel and skill, there is no need of springing work in the grinding machine. Again, the fact that a turned piece "runs out," means that the grinding machine has just that much more work to do. For instance, a piece of work that has, by measurement, .020 in. of stock to be removed from the diameter, will have the equivalent of .030 in. of stock provided it runs out .010 in. (indicated). Thus we see that, even by omitting the straightening operation which would still further militate against the lathe, there is a gain of 13 per cent. in favor of the grinding machine.

The same general proposition holds true even when there is too much stock to allow the grinding machine to be economically used in the roughing operation.

Pays to Save Time on Lathe.

In this case, it can be laid down as a rule that it pays to save time on the lathe and give the grinding machine more to do. This means get rid of the great bulk of the stock as rapidly and with as little attention to refinement as possible, even to the extent of sometimes taking two or three very coarse chips in preference to one fine one.

The proposition is true because while a coarse chip leaves a very rough surface that, apparently, has much stock to be removed, this surface consists principally of the points of small triangles and the heavy modern wheel makes them disappear "like chaff before the wind."

This is better realized when it is learned that a shaft 20 in. long is turned at 15 threads to the inch by a "round nose" tool to a diameter of 2.425 in. at the tops of the tool marks was reduced to 2.400 in. (the bottom of the tool marks) in one minute of cutting time. This is an apparent stock removal of 1.9 cubic inche sper minute, and enables one to understand why the old-fashioned "finishing cut is doomed.—Grits and Grinds.

STRATFORD APPRENTICES CARRY OFF THE HONORS.

THE results of the G.T.R. apprentice competition over the system, just announced, show that Stratford apprentices again head the list, having taken the highest average marks over the system for mechanical drawing, also for practical mechanics.

The competition for the capital individual prizes over the system, which is open to apprentices at the different stations taking the highest number of marks in each subject, is to be held at Allandale on the 19th and 20th inst. There are six of the Stratford apprentices competing for this prize in practical mechanics and five in mechanical drawing. Six of these in practical mechanics received 100 per cent. in marks, as follows:—A. J. Reeves, J. K. Hamilton, R. McCardle, A. W. Barnes, A. McDowell and H. Colombo. In mechanical drawing the following boys received 98 per cent. each, and are entitled to compete for the capital prize in drawing:—A. J. Reeves, A. W. Barnes, E. J. Wilhelm, H. Jones, A. Jones.

COMING CONVENTIONS.

American Iron and Steel Institute.—New York, May 22-23. Hon. James T. McCleary, secretary, 30 Church street, New York.

Master Boiler Makers' Association. — Philadelphia, May 25-28. H. D. Vought, secretary, 95 Liberty Street, New York.

Master Car Builders.—Atlantic City, June 10. Joseph W. Taylor, secretary, Karpen building, Chicago.

Railway Electrical Engineers.—Atlantic City, June 10. J. A. Audrencetti, secretary-treasurer, C. & N. W. Ry., Chicago.

Railway Supply Manufacturers' Association.—Atlantic City, June 10-17. J. D. Conway, secretary, 630 Oliver building, Pittsburgh.

American Society of Mechanical Engineers.—June 16-19, Minneapolis (headquarters at University of Minnesota). Calvin W. Rice, secretary, 29 West Thirty-ninth street, New York.

American Institute of Chemical Engineers.—Troy, N.Y., June 17-20. J. C. Olsen, secretary, Brooklyn Polytechnic Institute, Brooklyn, N.Y.

Railway Master Mechanics.—Atlantic City, June 15-17. Joseph W. Taylor, secretary, Karpen building, Chicago.

American Society for Testing Materials.—Atlantic City, June 30-July 4 (headquarters Hotel Traymore). Prof. Edgar Marburg, secretary, University of Pennsylvania, Philadelphia, Pa.

Railway Tool Foremen's Association. — Chicago, July 20-22. A. R. Davis, secretary-treasurer, 730 Pine street, Macon, Ga.

Railroad Master Blacksmiths. — Milwaukee, August 18-20. A. L. Woodward, secretary, C., H. & D. Railway, Lima, O.

American Foundrymen's Association. — Chicago, September 7-10 (headquarters Hotel LaSalle). A. O. Backert, secretary, Penton building, Cleveland.

Railway Bridge and Building Association. — Los Angeles, October 20-22. C. A. Lichty, secretary, C. & N. W. Railway, Chicago.

Bridge and Building Supply Men's Association. —Los Angeles, October 20-22. H. A. Nealy, secretary, Joseph Dixon Crucible Company, Boston.

Railway Electrical Manufacturers' Supply Association. — Chicago, October. J. Scribner, 1010 Monadnock building, Chicago.

GASES IN STEEL.

THE gas in blow holes is not, as many foundrymen believe, trapped air, but consists mainly of hydrogen and carbonic oxide with a small quantity of nitrogen, according to Professor Arnold in a lecture on the internal structure of steel before the Sheffield district branch of the British Foundrymen's Association. The question of gas in steel, he said, is the one branch of metallurgy that science has not yet been able to penetrate; that it is possible to get a volume of gas out of sound-looking steel several times as great as the volume of the steel itself, and that, as to the effect which this gas has on the properties of the steel, we do not know in what form it exists or what is its action.

Professor Arnold added:—"In Sheffield at the present moment experiments are being carried out on a large scale to remove this dissolved gas from steel, and I think they present a considerable prospect of success. When this is done, we are face to face with a new steel which has not been known before to steel metallurgy: a steel which has not only been deoxidized, but very largely degasified, and I will predict we shall find that steel with the same composition in many respects will have very different properties from steel containing dissolved gas. The future will prove whether the prediction I have made will come to pass."

FOUNDRY HINTS.

By R. Micks.

1—Keep all flasks in A1 condition.

2—Always order your cores as early as possible.

3—Consult previous day's core-room report when handing out jobs to secure no delays.

4—Study your molders, and give each man the class of work he can do best.

5—Have a place for everything and see that it is kept there.

6—Have daily report sheets for every department, so you can tell how you stand on any order.

7—Check up your reports every day and you will not overrun your order.

8—Watch your cupola practice and mixture, as most furnacemen do too much by guess.

9—Handle your men like men and they will use you in like manner.

10—Let no day pass that you do not try to improve on your present system.

SYSTEMATIC BUSINESS MANAGEMENT

Practical Articles for Managers, Superintendents, and Foremen, to Assist in Carrying on the Business Economically and Efficiently.

DICTATED BUT NOT READ.

SENDING a "dictated but not read" letter is about on a par with sending a salesman to a customer with a note such as this: "This is our salesman all right, but we are not responsible for his representation of our goods."

The fellow who invented the "dictated but not read" stunt must have been a cheap mail order crook, who wanted to create the impression that he was very busy indeed.

It is a very bad example to follow, for the man who hasn't time to read his letters ought to have a capable assistant to dictate and read and sign his correspondence, or else he ought not to be in business.

The "dictated but not read" letter is a reflection upon the stenographer as well as upon the office staff and the methods of the concern; moreover, it is an insult to the recipient. It is apt to convey to him the impression that this wasn't a very important letter, and that the sender didn't think enough of it to read it or see that it properly conveyed his message.

Still, some concerns do continue to send them out.—Pacific Stationer.

THE HABIT OF DOING ONE'S BEST.

THIS habit of always doing one's best enters into the very marrow of one's heart and character; it affects one's bearing, one's self-possession. The man who does everything to a finish has a feeling of serenity; he is not easily thrown off his balance; he has nothing to fear, and he can look the world in the face because he feels conscious that he has not put shoddy into anything, that he has had nothing to do with shams and that he has always done his level best. The sense of efficiency, of being master of one's craft, of being equal to any emergency, the consciousness of possessing the ability to do with superiority whatever one undertakes, will give soul satisfaction which a half-hearted, slipshod worker never knows.

When a man feels throbbing within him the power to do what he undertakes as well as it can possibly be done, and all his faculties say "Amen" to what he is doing, and give their unqualified approval to his efforts—this is happiness, this is success. This buoyant sense of power spurs the faculties to their fullest development. It unfolds the mental, the moral, and the physical forces, and this very growth, the consciousness of an expanding mentality and of a broadening horizon, gives an added satisfaction beyond the power of words to describe. It is a realization of nobility, the divinity of the mind.—Success.

THE MAN WITH THE SPARK.

HAVE you ever seen an automobile standing on the road, apparently spic-and-span and in good condition, yet absolutely powerless? It may have electric lights and self-starter and "one man top" and demountable rims, and twelve-inch upholstery, but while it is a thing of beauty it is not a "joy forever"—at least not until the garage man comes along and brings a new set of batteries, for the trouble is, the car has lost is spark. Without that spark all else is useless.

Many men there are similarly affected—men who have lost their spark—who possess outward appearance, gentility; who are willing enough to do; who may have had a good education; who show up well enough until action is required!

Every business seems to have its quota of these "sparkless" men. In surface analysis their opinions shine like the 1914 car, but when they are needed to put "punch" or "go" into a proposition, they "miss" in every cylinder.

The spark of originality—that's the most difficult of all to strike.

The spark of energy—just as necessary.

The spark of sincerity—how rare, only those experienced in the quest can verify!

Some men have energy in static form—as in the car with the batteries. They must be "charged" at regular intervals, or they will run down.

Others have a dynamo spark—self-created. Their mental magneto is always on the job. They climb hills of difficulty with ease, go through the rough places of a campaign "sweet running"—and they have plenty of reserve power.—Richard A. Foley in The Advertising Digest.

Lubricating Hack-Saws.—To make a hack-saw cut metal more smoothly and rapidly with less noise, and last longer, use thereon as lubricant a mixture of two parts of tallow and one of good black lead graphite—plumbago.

SCHOOLS AND SCHOOLING.

"EVERY man is as Nature made him," said Douglas Jerrold, but some are a damsight worse.

The reason is obvious; we go through life as if we had a cat's immortality, believing that there are eight others to follow; we give no thought to careful and systematic self-culture; we go to school because we must, and we leave it as early as we dare. Education is a matter of statute, and not of desire.

There is a law throughout Nature which tends to defeat what is not trained; we see evidence of it in our fields and in our business. The one thing which Nature will not stand for is the feeling that a thing is good enough. The thing that is good enough will soon be good for nothing.

Caesar Augustus said Rome was great enough, and the "Law of defeat" got right to work and tied the can on its progress. This law governs man. It allows him to quit school, but it defies him to quit schooling. If it doesn't keep him in training, he'll go backward—there is no stationary condition.

I know a man who when he left college did not leave behind him the desire to train on. He read good books, not in a systematic way, perhaps, but he read them just the same. He was partial to those little classics that he could slip into his coat pocket, and the time he spent on the street cars and on trains was put in reading them, instead of looking vacuously out of the window or staring vulgarly at the man across the aisle. The cumulative benefit of these "half hours" of study can never be computed. Stretched over a period of twenty years they gave him a fair hold on art, literature, science and history. I might even confess that they gave him what little ability is required to write this magazine every month.—Nelson Macy in Common Sense, the house organ of Corlies, Macy & Co.

SUCCESSFUL PROFIT SHARING.

ON Christmas Eve, 1912, Charles P. Foote, president of the Clipper Belt Lacer Co., Grand Rapids, Mich., announced a profit-sharing plan. A year previous the plan was first tried out in the hook carding department. The girls at that time were assured that all increased earnings would be theirs and that the piece rate would not be lowered, no matter how much they

made. The result of the experiment was that the girls from earning their former wage of $7.50 a week increased their earnings to a point where the more skilled operatives were making $12 to $15 a week and the less skilled averaged a little over $10. The output per operative was increased nearly 50 per cent., thus reducing the overhead cost to the management, in spite of the great increase in wages paid.

Encouraged by this experiment, the company announced through F. A. Stone, the secretary-treasurer of the company, in a general Christmas letter that " all who at the end of 1913 have been with the company one year or less will receive five per cent. in cash of the amount they have been paid during the year. All who have been two years in the employ, six per cent.; three years, seven per cent., and so on, one per cent. added each year, until the amount has reached 10 per cent., where it will remain indefinitely, provided the profits of each year warrant it. A nine-hour working day will be established, with Saturday half holidays without a reduction in pay."

Christmas, 1913 Distribution.

On closing the books for 1913 it was discovered that over $3,000 were available for distribution under the plan outlined, one stenographer and one drayman earning the maximum 10 per cent. dividend. The dividends were placed in the pay envelopes Christmas Eve, 1913, with a little note expressing the gratification of the company that the amount was as large as it proved to be, and expressing the hope of still better things in the year to come. The good will that this distribution engendered was an inspiration to the management and many incidents came to their notice where this Christmas present helped an employee over serious trouble.

Early in January the cottage occupied by one of the girls in the hook department was totally destroyed by fire, not even the furniture or household effects being saved. She and her mother had never felt they could afford to carry insurance while making payments on the home, but when the Christmas check came they decided that insurance on both the home and contents would be the very best use they could put it too. The fact that they were insured was, therefore, wholly due to this timely sharing of the year's profits.

Outside of the indirect benefit of a closer bond of fellowship with their employees, the direct results of the profit-sharing plan were as follows:

The yearly output was nearly doubled, with only a slight increase in force. Cost of the Clipper belt lacer was reduced nine per cent., in spite of the fact that the men making it increased their earnings 20 per cent. The output of one important piece of work for which 20 cents was being paid on piece work was so greatly increased that, figured on the former daily wage basis, it would have cost only 11 cents labor per piece.

Figuring all departments, the average gain to operatives was 19 per cent., and the average direct gain to the company nearly 9 per cent.

UTILISATION OF EXHAUST STEAM

SOME valuable data as to the advantages realizable by utilizing, in steam-turbines, the steam now wasted at many collieries and iron works were included in a paper read before the Nottingham Society of Engineers on March 11 by Mr. W. C. Mountain, M.I. Mech. E. The steam consumption in the case of a 750 k.w. plant working under different conditions was said to be as follows:—

WITH DRY SATURATED STEAM SUPPLIED AT 70 LB. GAUGE PRESSURE.			
Vacuum	26	27	28
Consumption at full load ..... lb. per kw. hour	30.5	26.8	25.0
Consumption at three-quarter load ..... lb. per kw. hour	29.5	27.8	26.0
Consumption at half load ..... lb. per kw. hour	32.2	30.3	28.3
WITH EXHAUST STEAM AT 16 LB. ABSOLUTE.			
Vacuum	26	27	28
Consumption at full load ..... lb. per kw. hour	39.3	36.5	31.7
Consumption at three-quarter load ..... lb. per kw. hour	41.0	37.1	33.1
Consumption at half load ..... lb. per kw. hour	44.2	40.0	35.7

As illustrating the amount of exhaust steam available at collieries, Mr. Mountain gave the following figures of the consumption of non-condensing winding engines in different cases:

Size of Winding Engine.	Consumption per Shaft Horse-Power.	Boiler Pressure.
in.		
32×72	129	...
45×84	83	80
18&28×84	177	140
36½×78	114	60
36×78	95	180
32×72	70	120
40×78	48	105
32×72	102	80
36×72	129	80
22×52	58	100
40×78	88	100
26×54	43	127
60×84	178	20

The cost of a mixed-pressure turbo-generator plant with condenser and all accessories was stated to be about $30,000 for a 500 kw. installation; $35,000 for a 750 kw. plant; and $42,500 for 1,000 kw. unit. Taking interest at 5 per cent., and depreciation at 10 per cent., the total annual costs would be $7,000, $8,000, and $9,500 per annum respectively.

In this estimate no allowance is made for the value of the waste steam. The cost per unit with a load factor of 100 per cent. would be .152, .116, and .104 cents for the three plants respectively, which, if a stand-by plant were also provided, would be increased by about 50 per cent.—Engineering.

WHAT IS AN OPTIMIST?

"AN OPTIMIST," said Mr. J. L. Garvin, the brilliant editor of the "Pall Mall Gazette" and "the Observer," "is a man who sees every difficulty in his path, who is not daunted by them, who hopes for the best, who leaves as little as possible to chance, and who works like a tiger."

Mr. Garvin, who was unconsciously describing himself in these words, was the guest of the Optimists' Club, London, at their monthly dinner—a gathering of many business men whose creed is that optimism is the secret of business success.

"Looking at life from my point of view," he said, "one thing which is of much effect is imagination—the play of ideas. A man should strive to his utmost not to be a victim of routine, but see the world a fresh thing every morning. He must say, 'How is this thing done; how can it be improved?'

"The difference between men who do not count and men who do count is measured by the extent to which they embody the thoughts and actions of other men, or bring a fresh store of perception to reinforce the common stock. All success worth having is no more than ideas realized in action, and the man who believes life is worth living, and puts both hands to the task he has undertaken is far more likely to have ideas if only from the necessity of having them, than the weary Willies of the moral world who think there is nothing new, and nothing true, and that it doesn't matter anyway.

"Optimism in action," he declared, "is the secret of the 'Nelson touch.'"

Finding Compressed Air Leaks. — When steam escapes you can generally see or hear it, and when there is a leak in an ammonia pipe line that also is immediately evident, but a leak in a compressor air line entailing an appreciable loss may go for a long time unnoticed; not that it is more difficult to make the air line tight, and to keep it tight, than the others. An Illinois manufacturer at regular intervals puts essence of peppermint into the air system, and then has all the pipes inspected for leaks. If the smallest amount of air escapes anywhere it is revealed by the odor.—Ex.

STRESS ON BOLTS OF SPLIT FLY-WHEEL.

By J. R. Brodie.

I NOTICED in a recent issue of your journal a problem propounded by Mr. Westwood regarding the stresses acting on the bolts of a split fly-wheel. As such discussions tend to add to the interest in your journal, I shall endeavor to set forth my theory and a calculation. The data given are as follows:—

Diameter 12 ft., r.p.m. 150, and weight 10 tons. The hub was held intact by four 2½ in. bolts, with an initial stress in each of 1,000 pounds, and the rim was secured by four 2 in. bolts, each under an initial stress of 700 pounds.

The stress in the rim of the fly-wheel is found by the following formula (a):

$$S = \frac{R \times N^2 \times W \times F}{2 \times 3.1416} \text{ where}$$

S=Total rim stress in pounds.

R=Mean radius of fly-wheel in feet.

N=Number of revolutions per minute.

W=Weight of rim in pounds.

F=Constant for centrifugal force of whole rim=.000341.

3.1416=Ratio of circumference to diameter of circle.

The weight of the rim is not given and, for this reason, it is necessary to ascertain its stress per sq. inch.

The weight of a cast-iron rim may be found by formula:

$W = 2 \times 3.1416 \times R \times 3.125$, where

W=Weight of rim.

3.1416=Ratio of circumference to diameter.

3.125=A constant for cast-iron.

R=Mean radius of wheel.

Weight of rim=$2 \times 3.1416 \times 6 \times 3.125$ =117.813 pounds.

By formula (a), the total stress in section of rim one inch square and 12 ft. diameter will equal

$$S = \frac{6 \times 22500 \times 117.8 \times .000341}{6.2832} = 863$$

pounds per sq. in.

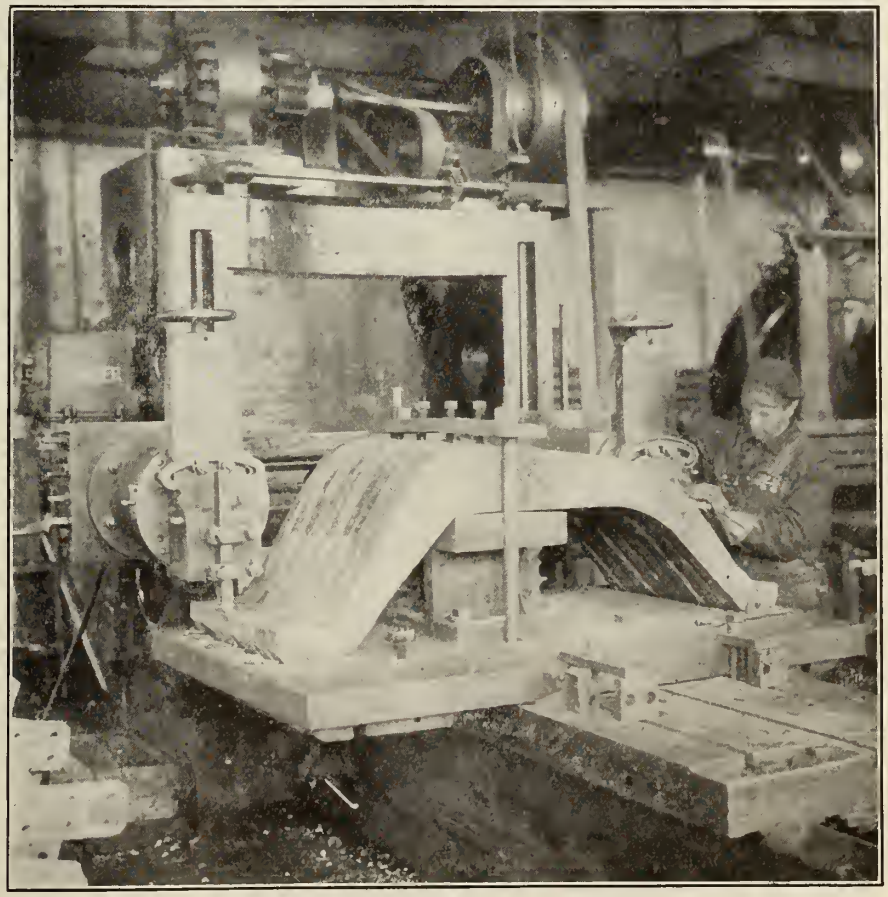
The width of the crown and its thickness are not given. Therefore it is necessary to base the calculation for the total weight of the rim upon the assumption that the dimensions are as follows:—Width 18 in., thickness 4 in., or cross sectional area=18×4=72 sq. in.

The total stress on the rim in pounds =sectional area in sq. in. $\times$ 863= 72×863=62,136 pounds.

Area of a 2 in. bolt=3.1416 sq. in., and total stress on each bolt=62.136÷4 =15.534 lbs. The initial stress on each rim bolt due to the tightening is 700 lbs.

Now, if the strains on the bolts increase in proportion to the loads they are called upon to carry, the total stress on each bolt is 15,534 + 700=16,234 pounds. The stresses on the hub bolts, in my opinion, are very moderate, and are, therefore, not considered.

It was said by "Centrifugal" that the speed of the wheel was too high. The maximum allowable strain in a cast-iron fly-wheel rim is 1,000 pounds per sq. in., which corresponds to a rim velocity of 6,085 ft. per minute, which brings the wheel in question within safe limits. Its rim velocity is 5,655 ft. per minute, while the rim stress is 863 pounds per sq. in.



MACHINING TRUCK EQUALIZERS.

By J. H. W.

AT the Dominion Works of the Canadian Car and Foundry Co. a great economy has been effected in machining passenger car truck equalizers by the use of the device here illustrated. The equalizers are approximately 66 inches over all, yet are planed on a 30-inch planer. This is effected by mounting the tool heads on two extensions, and clamping the work on an auxiliary table mounted on the planer table.

The equalizers, which are for six-wheel trucks, are set up in batches of eight (one set) at a time, and are supported by a block machined to the correct height. This block is an old flanging die picked off the scrap heap. As may be seen, it is planed off at the top in such a way that the equalizers have only an inch or two of bearing on it in order to facilitate setting up the work. The auxiliary table consists of a disused marking-off table, tapped for the holding-down bolts; so the fixture cost practically nothing.

In some shops these equalizers are machined one at a time on a shaper, but the Canadian Car and Foundry Co. find that their own method saves a great deal of time, in spite of the fact that it takes about an hour to set the work

MACHINING TRUCK EQUALIZERS.

up. The output is 24 equalizers a day, or three sets.

No doubt the job would take considerably more than an hour to set up if the equalizers were forged to a template; but the company's practice is to rough forge them and afterwards bend them to final shape in a bulldozer. The forgings are thus practically all the same size and shape, and no trouble is found in selecting sets of eight so nearly of a size that they can he set up together on the planer comparatively quickly.

THE AIR FURNACE IN THE FOUNDRY.

By U. K. N.

FOR many years the foundry cupola was considered the principal of the the various agents conducive to premature greyness in foundry managers, but with the advent of modern chemistry and scientific mixing of iron, the cupola and its vagaries have been thoroughly mastered. We are now informed, however, that the cupola has seen its day and that the air furnace is the last word in foundry practice.

While for many years the foundries producing the finest malleable castings have realized that the air furnace was essential to the best results, it is only recently that grey iron founders have turned to these furnaces for the solution of the problem of uniformity of product. To the small jobber, the air furnace is not a necessity, and owing to the increased cost of operation as compared with the cupola, it is doubtful whether it will ever be popular; but with the large foundry making machinery castings of intricate design and requiring unusual strength, the air furnace has already proved itself of remarkable value. So thoroughly are the qualities of air furnace iron appreciated on many Government contracts, and not only is the analysis of the castings designated, but it is expressly specified that air furnace iron must be furnished.

Superiority Over Cupola.

There are many reasons why the iron melted in an air furnace is, and should be, superior to that of a cupola. The principal point in favor of the air furnace is that the metal is not at any time in actual contact with the fuel and has no opportunity of absorbing impurities principally sulphur, from the fuel. Again, the fact that the entire charge is melted down before tapping guarantees that the metal is thoroughly mixed in the bath of the furnace and assures a uniformity not possihle where the iron is filtered down through successive layers of coke.

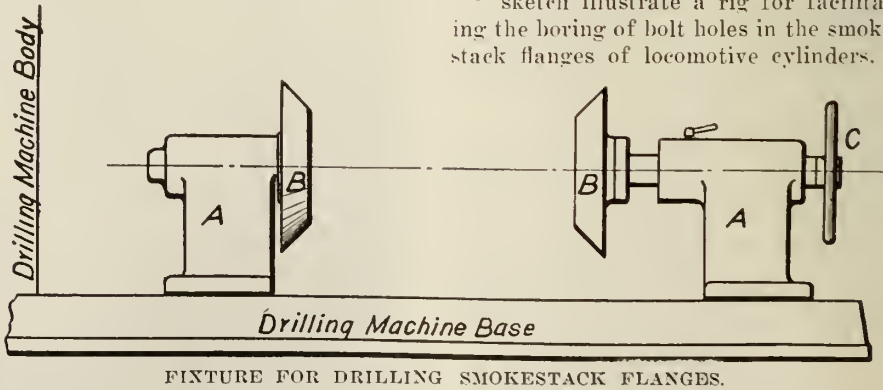
Every practical founder knows that no matter how carefully he watches the operation of his cupola there will be considerable variation in the sulphur content of his castings. As before stated, this is due to absorption from the coke, and while it may not be sufficiently excessive to cause trouble, still the fact remains that a variation of several points in sulphur occurs in successive heats. With the air furnace this is eliminated. If a mixture be charged to produce sulphur .04 per cent. in the casting, the analysis will show this amount, not only for one heat, but day after day so long as the particular analysis is desired.

Owing to the uniformity of melting in an air furnace, a considerably larger proportion of scrap or cheaper grade of iron may be used. This can be done without the sacrifice of strength, and bars breaking at from 4,000 to 4,200 are not uncommon, and this without a particle of steel in the mixture. Air furnace iron producing the much desired combination of low silicon and low sulphur assures castings of great strength, and an analysis of 1.20 silicon and .04 sulphur in the casting may be secured day after day. To obtain this in a cupola would necessitate the use of large proportions of high priced charcoal iron with best selected scrap, or probably No. 2 pig iron.

Air Furnace Disadvantages.

The most serious objection advanced to the installation of air furnaces is the cost of operation. However, this is not so formidable as might be supposed. Air furnaces are operated with soft coal with a melting ratio of one to four. This is as compared with cupola iron melted with coke at a ratio of about one to seven (including bed). When one considers that the price of 72 hour foundry coke is nearly double that of run-of-mine coal, the saving in favor of the cupola is not so pronounced.

There are advantages in favor of the cupola, however, that should not be overlooked. One of these is the facility with which small work may be poured. The usual method in handling an air furnace heat is to melt it down and take the iron out in either one or two ladles, depending upon the capacity of the furnace. It will be readily seen how impracticable it is to pour many castings weighing from two hundred to three hundred pounds with a ladle of low silicon iron holding possibly ten tons. To get around this, it is necessary to draw the metal in smaller ladles, plugging the furnace after each successive tap. When this is done it is doubtful whether the metal reaches all castings with the same degree of uniformity.



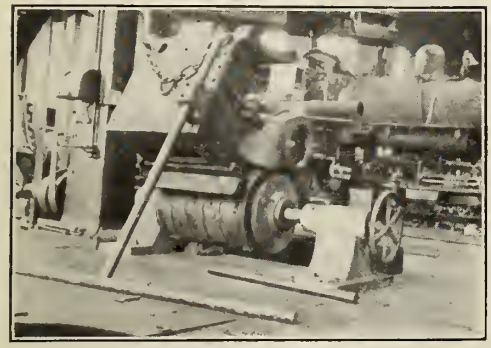
Another disadvantage of handling air furnace iron comes up in a shop where the character of the work requires iron of several different analyses during one heat. Take for example a shop pouring rolls where various depths of chill is required. It is physically impossible to accomplish this from one air furnace mixture, and it is manifestly not economical to operate an air furnace for each particular size of roll. Of course, the practice of taking several mixtures from a cupola during one heat is not conducive to accuracy, but where there is but one stack operating in the shop it is often necessary.

In the earlier furnace installations the iron was melted down by natural draught, but the present day desire for "speed" has developed stoker-fed furnaces operated by forced draught. There has been considerable objection to this upon the ground that there is excessive oxidation and danger of burning the iron. This criticism is probably not altogether borne out by experience, and forced draught furnaces produce equally as good iron in considerably shorter time. Taken all in all, the air furnace in the foundry has come to stay, and with the progressive foundryman its installation is always welcomed.

FIXTURE FOR DRILLING SMOKE-STACK FLANGES.

By E. W. Slingsby.

THE accompanying photos and sketch illustrate a rig for facilitating the boring of bolt holes in the smoke-stack flanges of locomotive cylinders.



FIXTURE FOR DRILLING SMOKESTACK FLANGES.

Two heavy cast iron brackets AA are rigidly bolted to the base of a radial drill with raising and lowering arm. Each bracket is fitted with a large cast

iron cone BB, which is free to revolve. The rear one has lead screw and hand wheel C for the purpose of feeding the cone up to the job like the tail stock of a lathe.

In operation, the cylinder casting is placed between the cones and clamped up with the hand wheel. It is located

DRILLING LOCOMOTIVE CYLINDER SMOKESTACK FLANGES.

DRILLING LOCOMOTIVE CYLINDER SMOKESTACK FLANGES.

and held at the correct angle by the leg bolted to the centre facing as shown in photographs, and is fastened by a locking handle provided. Previous to the adoption of this outfit the work was done with a pneumatic drill and much time was lost in adjusting clamps, old man, etc.

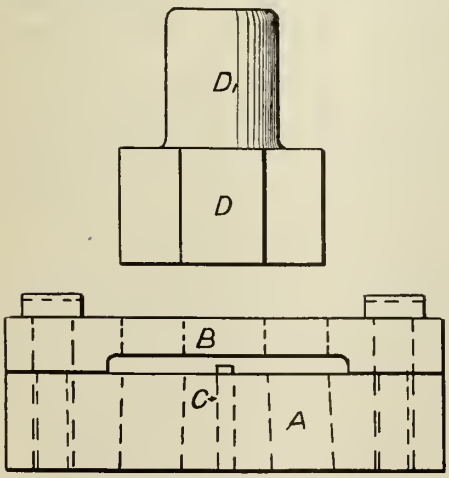
A SIMPLE HAND-PRESS JOB.

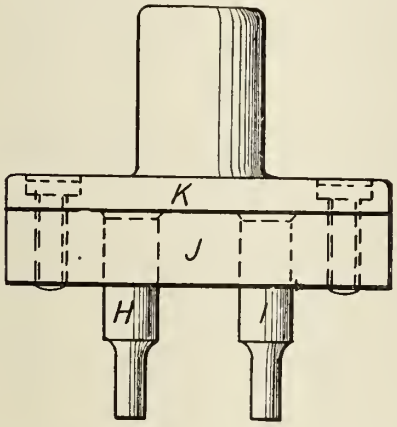
By W. G.

THE tools herein illustrated are primarily intended for use in a case where the total number of pieces to be

FIGS. 1 AND 2. FRONT AND END VIEW OF FINISHED COMPONENT.

produced is not sufficiently large as to warrant the outlay of a more expensive set of tools, yet at the same time to turn





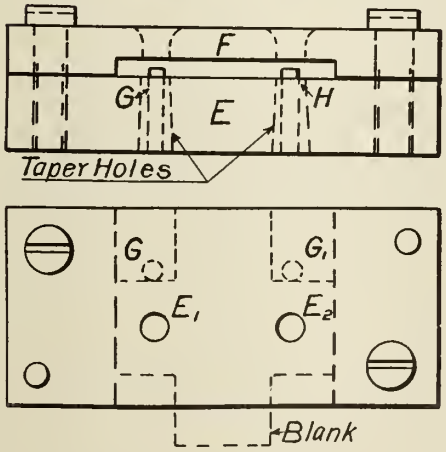


FIG. 3. SIDE ELEVATION OF PUNCH AND BLANKING DIE.

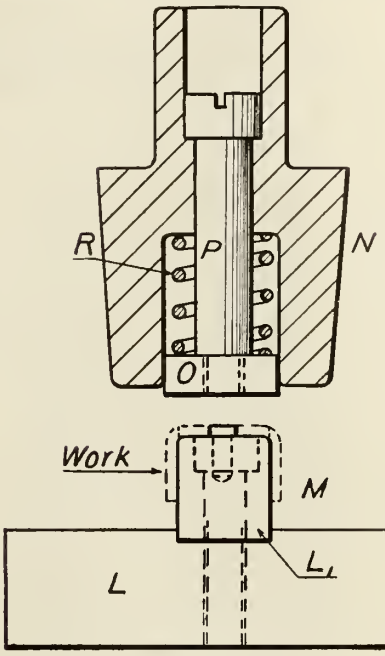
out work accurately and expeditiously. Figs. 1 and 2 are front and end views respectively of the finished component. Fig. 3 is a side elevation of punch and blanking die and Fig. 4 is a plan of die with punch removed.



The cutting bed or die A is made from a rectangular block of tool steel, and should, if possible be forged, as this adds considerably to its strength. It is very essential, however, that care should be exercised during hardening, as the succeess of the tool very largely

FIGS. 5 AND 6. FRONT ELEVATION AND PLAN OF PIERCING TOOLS.

depends upon this operation. Part B is the combined stripping and guide plate. This is made from mild steel, and is secured to the cutting bed A, by means of the cheese head pins and dowels as shown. The stop peg C is made from cast steel, its object being to provide longitudinal location of the "strip" when blanking.

FIGS. 7 AND 8. TOOLS FOR BENDING.

Part D is the punch; this being made from a rectangular block of tool steel. The shank D^1 is turned to a diameter to suit the hole in the press ram. Figs. 5 and 6 are front elevation and plan of

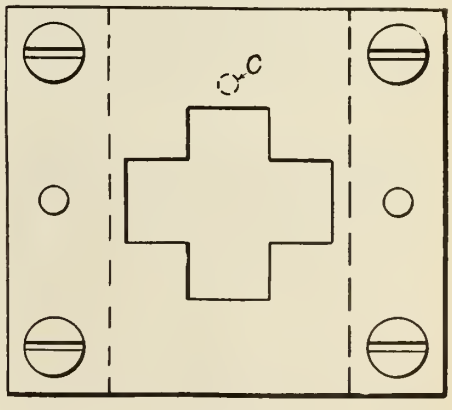


FIG. 4. PLAN OF DIE WITH PUNCH REMOVED.

piercing tools for the second operation. The cutting bed E consists of a rectan-

gular block of tool steel provided with two holes E_1 and E_2. It is essential that the said holes should be slightly tapered towards the base in order to provide the necessary clearance for the piercings; the taper, however, should not be less than 1° each side, otherwise the slugs will have a tendency to choke the die, thus causing considerable stripvenience. Part F is the combined stripping and locating plate, being made from mild steel, and secured to the die as shown. Parts G and G^1 are the stop pins for longitudinal location.

The piercing punches H and I are made from best cast steel carefully hardened and tempered, and should be a driving fit in the mild steel punch plate J; it is preferable, however, that the ends of the said punches should be slightly riveted over as shown, thus providing additional security. Part K is the punch plate holder. This is made from mild steel and is casehardened on its bearing face for the purpose of taking the thrust of the punches when in operation.

Tools for Bending Are Showing in Figs. 7 and 8.

The base L consists of a cast iron block, in the centre of which is provided a tongue groove L_1, the object of this being to provide location for the bending block M, which is made of mild steel and need only be surface hardened. The bending punch N is also made from mild steel, and should be casehardened. Part O is the pressure plate; this can be made from any suitable material, its purpose being to hold the component quite flat during the process of bending. The pin P is for securing the aforesaid plate to the punch body. It is very essential, however, that both plate and pin should be a free fit to the punch body, thus allowing the spring R to have full play upon the component.

SAFETY HINTS TO EMPLOYEES.

THE following safety hints appear in a recent issue of the Burrough's Adding Machine Co. Employees' Magazine, and are, we understand, the work of the company's superintendent, Mr. A. Brain.

1.—Treat your shopmates with courtesy and work in harmony with them.

2.—Acquire habits of caution for your own protection and for that of your shopmates.

3.—Use general tools with care and return them in as good condition as when taken.

4.—Avoid wearing loose fitting clothing and jewelry or gloves on or about the hands especially around machine tools.

5.—Before throwing on power always look the machine over carefully, and be certain every part is in working order.

6.—Adjustments and oiling should be avoided when a machine is running.

7.—Whenever possible, start a machine by hand, to be sure all moving parts are free.

8.—When in doubt concerning your work or the operation of any machine, ask your foreman.

9.—When operating a machine, give the work your undivided attention. It may save spoiling a job, if not more serious damage.

10.—When taking charge of any equipment, examine it carefully and report any breaks or defects, otherwise you will be held responsible.

11.—Never fool with a machine and avoid scuffling with shopmates during working hours.

12.—Do not leave material, tools, or work lying on the floor, where anyone might stumble over them, nor in overhead trestles or platforms, where they might fall or be jarred off.

13.—It is extremely dangerous to set cutting tools in a moving machine.

14.—Do not lounge on a moving machine and keep a respectable distance from all moving parts, especially gears and cutters.

15.—When through work, clean the bench, vise or machine with brush and waste, and see that all small tools are returned and checked.

16.—Before throwing in an automatic feed, be sure the stops are set so that no damage will be done either to the work or machine by its use.

17.—Form the habit of never standing in line with swiftly revolving parts, such as emery wheels, pulleys, etc.

18.—Practice economy in use of oil, waste, emery, files and other supplies, as careless waste of theee things causes enormous losses in many shopes.

19.—When working around a dangerous machine be sure good footing is provided and never remove guards or safety devices, unless absolutely necessary in order to do the work.

20.—Never leave waste or rags where they might ignite or cause fire.

21.—Grind off overlapping edges of chisels, drifts, punches, set hammers, etc.

22.—Never pound or hammer a file.

23.—Form careful habits and cultivate a thoughtful and deliberate frame of mind when about your work.

24.—An orderly exit of employees at noon is important, especially when it is necessary to descend staircases.

25.—The wearing of long coats by workmen will be discouraged. Aprons not ragged and fastened with strings that will break easily under strain are better.

26.—Never attempt to stop a machine by grabbing the belt.

27.—When replacing a belt, stop a machine dead or reduce speed less than one-half.

28.—In replacing belts, adjust them on the driven pulley first.

29.—When handling a belt between two overhead pulleys, never place the ladder between the shafts nor rest it against a revolving shaft.

30.—Do not be ashamed to shift belts with a stick instead of the hand, and for overhead work, always use a stick reaching nearly to the floor.

31.—If you will shift a belt by hand, use the palm with thumb and fingers extended and look out for metal splicings.

32.—Do not remove or tighten oiler nut by the power of the machine or without oiler being touched at outer end.

33.—Do not wipe chips from revolving cuter with the fingers or a steel scale. Use a brush on the off side and with care.

43.—Never reach across the revolving oiler to regulate the oil feed.

35.—Be sure stops are set and that everything will run clear during the entire cut before throwing in feeds.

NEXT STEP IN OUR CIVILIZATION. WHAT?

In an interesting article in the Manchester Guardian (England) the author asks what will be the next step in our civilization that will follow the iron age, or as some people prefer to call it, the steel age. Some day it is conceivable that the mineral and coal supplies of the world will give out, and then the world will have to fall back upon the vegeterian substances for all materials of construction, these being the only ones that can be reproduced with such rapidity that there would be a constant supply.

When this time arrives, the author says, the great bulk of the world's requirements will be met by the products of the field and the hill side. Fuel will either be grown directly, as timber, or more likely be distilled from suitable plants in the form of alcohol and oils. Structural materials will then, again, be mainly stone and wood, and only tools, ornaments, and products to meet special requirements would be made of metal. When such a time comes the world will literally go "back to the land" and evolve a new civilization, multiplying the productivity of the land to a degree at present beyond imagination.

In the history of the world, the present mineral age is but one brief day.

Series of Practical Questions and Answers for Mechanics

Every care is being taken to include only pertinent practical questions, and give same direct, reliable answers. Catch questions will be avoided. Attention is drawn to the alternating course in arithmetic, a concurrent study of which is recommended with that of the Question and Answer Series.

RELATIVE TO FALLING BODIES.

PRINCIPLES.—All bodies fall equally fast. That is, a piece of paper and a stone, if dropped into well at the same instant, would reach the bottom at the same time, but for the resistance of the air which has a greater effect upon the lighter bodies. In the following problems the effect of air resistance is not considered.

A falling body accelerates uniformly or, in other words, it gains exactly the same amount of speed for each second during its fall. This increase in speed is known as the force of gravity or (g) and varies slightly at different points on the earth between the equator and the poles. Its value for our latitude is 32.16. It is easily seen that, if a falling body gain this amount in speed each second, its speed at the end of two seconds will be 64.32; at the end of three seconds, $32.16\times3=96.48$ feet per sec. and so on. From this we get the formula

$$v=gt \quad (1)$$

where v=velocity in ft. per sec.
t=the time in seconds during which the body falls.
g=the force of gravity=32.16.

* * *

Question.—What would be the velocity ottained by a brick after falling during 7 seconds?

Answer. — $v = gt$ or $v = 32.16\times7 = 225.12$ ft. per sec.

* * *

Question.—From what height must a stone be dropped in order to strike the ground with a speed of a mile a minute?

Answer.—A mile =5280 ft., and a mile in 1 minute

$$=\frac{5280}{60}=88 \text{ ft. per sec.}$$

For determining the distance in problems of falling bodies we use the formula,

$$h=\frac{v_2}{2g} \quad -(2).$$

The height from which a body must fall to attain a given velocity equals the square of the given velocity divided by 2×32.16.
In the above formula,
v=velocity in ft. per sec.
h=height in feet.
g=force of gravity=32.16.
Supplying values,

$$h=\frac{88\times88}{32.16\times2}=120.39 \text{ feet.}$$

Question.—Considering that Niagara Falls is 160 feet high, at what speed does the water strike the bottom?

Answer.—Changing the above formula to suit this case we have

$$h=\frac{v^2}{2g} \text{ that is } v^2=h\times2g \text{ or } v=\sqrt{2gh},$$

applying this to the problem
$v=\sqrt{2\times32.16\times160}=104.4$ ft. per sec.

* * *

Question.—A man in a balloon drops a sand bag from a height of 5,200 ft. How long would it take to reach the earth?

Answer.—Where time is involved we use the formula $h=\frac{1}{2}gt^2$—(3). Changing this to find t we get

$$t=\sqrt{\frac{2h}{g}} \text{ where t is the time in seconds}$$

$$\text{or } t=\sqrt{\frac{2\times5200}{32.16}}=\sqrt{323.38}=17.98$$

seconds.

* * *

Question.—A gun in the crows nest of a battleship, 90 feet above the water, discharges a shell in a horizontal direction, with a muzzle velociety of 144,000 feet per minute. What will be its range?

Answer. — The motion given to the projectile by the powder does not affect the force of gravity and it will strike the water in the same time as if it were dropped. This time would be, according to formula.

$$t=\sqrt{\frac{2h}{g}} \text{ or } t=\sqrt{\frac{2\times90}{32.16}}=\sqrt{5.5970}$$

$=2.37$ seconds.

In 1 min. the shell goes 144,000 feet horizontally. In 1 sec., it travels $\frac{144000}{60}$ and in 2.37 secs, $\frac{144000}{60}\times2.37=$ 5688 feet or a little more than a mile.

* * *

Question.—A ten-foot fiy wheel bursts at 1,000 r.p.m. (1) How high will a piece of the rim go which happened to fly straight upwards? (2) At what velocity will it go through the roof 60 ft. above?

Answer. — (1) The initial velocity would be

$$\frac{10\times3.1416\times1000}{60}=523.6 \text{ ft. per sec.}$$

The height to which a body will go is the same as that from which it would have to be dropped in order to acquire the same velocity. Therefore,

$$h=\frac{v^2}{2g} \text{ or } h=\frac{523.6\times523.6}{2\times32.16}=4262.3 \text{ ft.}$$

Answer.—(2) This velocity would be the same as if it were dropped from a height 60 ft. less than this or 4262.3—60=4202.3 ft., using formula
$v=\sqrt{2gh}$ or $v=\sqrt{2\times32.16\times4202.3}$
$=519.89$ ft. per sec.

* * *

Question.—If a 12 -inch emery wheel should burst while making 2820 r.p.m., what would be the greatest horizontal distance that one of the pieces could go?

Answer.—The greatest possible range would be attained by a piece flying off at an angle of 45 degs. with the horizontal. Its initial velocity in this direction would be

$$\frac{2820\times3.1416}{60}=147.655 \text{ ft. per sec.}$$

Its horizontal and vertical initial velocities would be represented by the sides of a right angle triangle, whose hypotenuse is at an angle of 45 degs. In which case, both sides would be the same.

The horizontal initial velocity would be the cosine of 45 degs. × 147.655 or $.70711\times147.655=104.404$ ft. per sec. The vertical initial velocity would be 147.655 multiplied by the sine of 45 deg., which is, for this angle, of course, the same thing.

The time during which a body is rising is the same as would take it to gain this same velocity in falling from rest and the total time of flight would be twice this as it also has to come down. The formula for this would be

$v=gt$ arranged to find (t) or $t=\frac{v}{g}$

$$\text{or } t=\frac{104.404}{32.16}\times2=6.49 \text{ seconds.}$$

Its horizontal speed is uniform and is 104.404 ft. per sec. Therefore, the distance it travels is 104.404.49=677.582 ft.

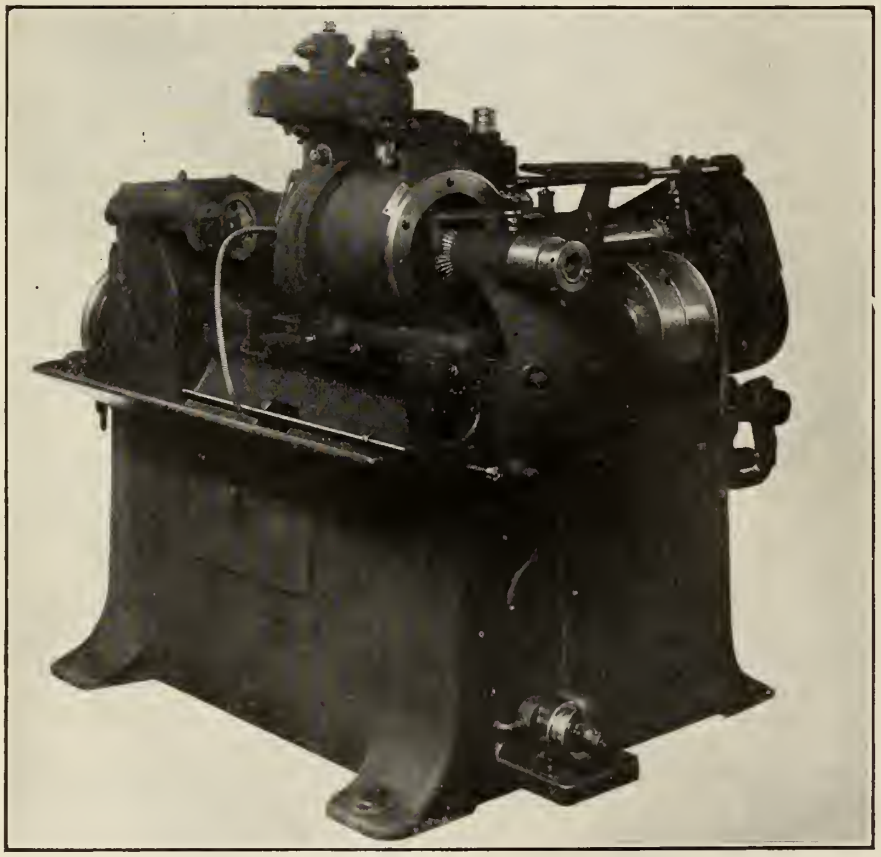
* * *

Question.—In the above problem, how high would the piece go?

Answer.—From the former solution we find that its initial velocity in a vertical direction is 104.404 ft. per sec.
Using formula $m=\frac{v^2}{2g}$ we have height

$$=h=\frac{104.404\times104.404}{2\times32.16}=169.47 \text{ feet.}$$

DEVELOPMENTS IN MACHINERY

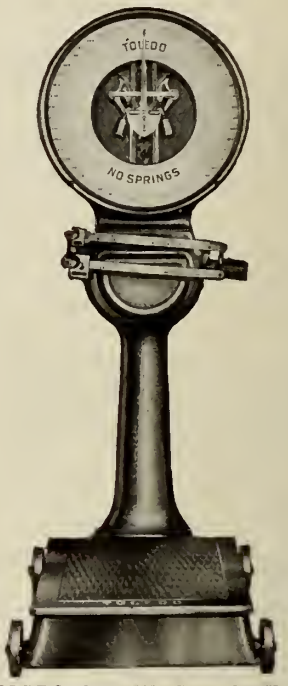


A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

IMPROVED GEAR GENERATING MACHINE.

THE Lees-Bradner Co., Cleveland, Ohio, builders of automatic gear generators and thread milling machines, have recently improved the drive of their No. 5 gear generator, as will be seen by referring to the illustration here shown. The improvements are as follows:—The cone pulley drive has been replaced by a single pulley drive situated below the shaft on which the cone was previously located, and from this lower shaft, gears transmit the power up to the original shaft, giving nine changes of speed to the cutter, with a range of cutter revolutions from 44 to 147, and a back gear range of 3 1/3 to 10.8 to 1. The extreme back gear of 10.8 to 1 makes it possible to take advantage of the rigid construction of the machine when using coarse pitches, and the low back gear of 3 1/3 to 1 makes the production very good when using small hobs of light pitches.

The machine automatically stops when the work is completed, and the lever for starting up again is located at the front of the machine just to the left-hand side of the micrometer hand wheel. The longitudinal feed of the work slide is controlled by a jaw clutch operated by a hand lever from the front of the machine replacing a friction clutch. A new shield has been supplied for the feed gearing, which is readily swung back to cover the gearing when in use from the rotation shaft to the feed screw when used on the Universal machine. This new design is readily equipped with an electric motor drive of a constant speed, as a motor can be located at the rear of the machine either above or below the main pulley. The loose pulley is mounted on roller bearings running on a hardened and ground bushing, thus eliminating the trouble so often encountered with loose pulleys wearing their bearings out and becoming noisy and inoperative.



The machine will cut spur gears, helical gears, worm wheels, and thread worms. The standard type takes work up to 14 in. diameter, while the special machine takes work up to 17½ in. diameter. Worms 8 in. diameter and 8 in. long up to 1 in. c.p. can be threaded on the Universal machine.

IMPROVED GEAR GENERATING MACHINE.

THE TOLEDO HEAVY CAPACITY SCALE.

AN interesting and serviceable type of weigh scale is being put on the market by the Toledo Scale Co., Toronto, Ont., for use in factories where a rapid indicating and accurate register is required. The accompanying illustration will give the reader an idea as to the general design of the apparatus.

THE TOLEDO HEAVY CAPACITY SCALE.

The mechanism, situated behind the dial, is exposed to view, but is in a dust-proof housing. It consists essentially of floating compensating double pendulums, one counter-balancing the other, thus preventing inaccurate results when the scale is used on an uneven floor. Springs have been eliminated entirely, thus giving the scale a greater degree of accuracy and longer life. The lever shown in front is the tare-arm. This device makes it possible, when weighing goods in trucks or boxes, to deduct the tare, the scale automatically showing the net weight of the goods. This feature is claimed to effect a considerable saving in time.

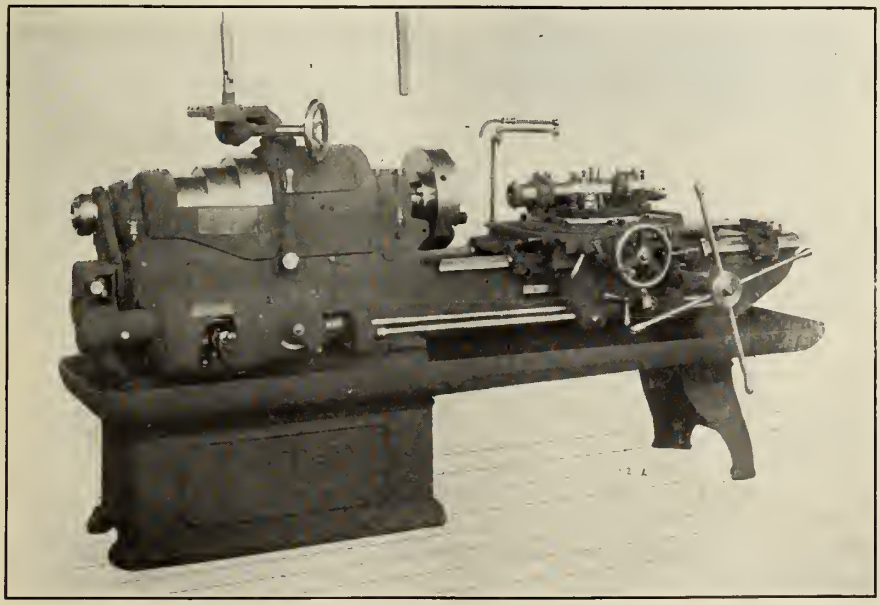
The bearings are made of special tempered steel, and are self-aligning, besides conforming to the knife-edge pivots in their natural position throughout the entire bearing surface, thus eliminating wear. The weight is registered on a dial similar to that of a clock, by an indicating hand which travels round.

The scale is fitted with a brake, which holds the machine in a fixed position when in use. At the back of the scale is a handle which, when turned, releases the brake, so that the scale can be moved. The weighing mechanism is at the same time automatically locked, thus eliminating any possibility of damage when being moved over rough surfaces. In the dormant—that is to say, stationary scale—this feature protects the indicating mechanism when the scale is not being used.

The speed of the scale is controlled by a dash-pot regulator, which checks the vibration of the indicating hand. The scale is also equipped with a shock-absorber, which, in connection with the dash-pot regulator, relieves the weighing mechanism of any shock from goods being dropped on the platform.

These scales are made at the company's factory at Windsor, Ont., in sizes, with capacities from 250 to 1,500 pounds.

CROSS SLIDE FLAT TURRET LATHE.



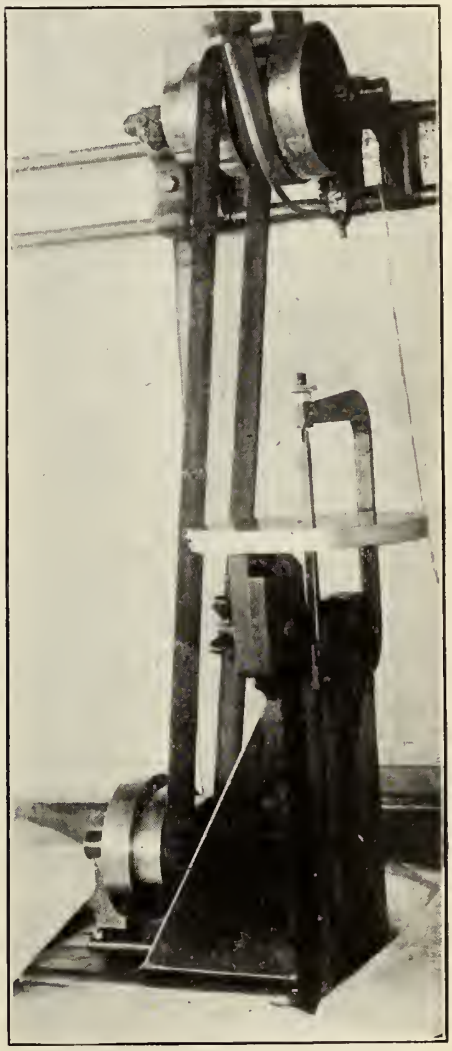
THE 2¼ by 26-inch **Modern** cross slide flat turret lathe, here described and illustrated, is a product of the Modern Machine Tool Co., Cincinnati, Ohio, and embraces all the features of the **Modern** rigid flat turret lathe, with the exception of those enumerated as follows:—

The cross-slide has 195 square inches of bearing surface on the carriage, and has a long narrow dovetail guide to prevent cramping. It has full length taper gib to take up wear and a parallel gib on the rear for holding down. The centre position is automatically and positively located by a taper locking bolt on the head end of the carriage, which may be disengaged when the cross-feed is used.

The cross-slide has ten stops, which stop the slide in either direction, and has 7 in. of travel. The ten stops may be used for one tool or in combination for any series of tools. The stops are engaged by a series of plungers located at the front of the carriage, all of which are operative from any location of the slide. The graduations for micrometer adjustment of the cross-slide are located on the periphery of the cross-feed screw hand wheel.

The cross-slide has independent feed in both directions, and may be engaged while the machine is in operation; the start, stop and reverse being controlled by a single lever entirely independent of the carriage feed. When cross-feed is operated by hand, the screw with two bevel gears are the only moving parts. A 15-in. three-jaw geared scroll chuck, with four sets of jaws, is regularly furnished.

The swing over the vees, carriage and turret is 20 in., 16 in., and 6 in. respectively; the travel of carriage 26 in., and that of the cross-slide 7 in. The range of speed is from 18 to 350, and that of the feed from .005 to .085, while the floor space and net weights are 4 ft. by 11 ft., and 6,150 pounds respectively.



CROSS SLIDE FLAT TURRET LATHE.

BENCH FILING MACHINE.

THE bench filing machine, here described and illustrated, is designed particularly for work where it is desired to file perfectly straight and true surfaces to any required angle, such as cutting dies, jigs and template work. The height from bench to table, which is adjustable, and of 9 inches diameter and graduated, is 18 inches. The stroke has adjustment of from 2 inches to 5 inches. The machine has three-step cone pulley drive, and weighs about 145 lbs. complete, with counter ready for shipment.

This filer will not take the regular stock files, a special parallel file being used, which is supported from both ends, the same as a jig saw. The files are 8 inches in length, and are used like a hack saw blade. With this machine, it is claimed, accurate work can be rapidly produced, using either files or saws. Files are carried in stock by the makers of machine, the B. C. Ames Co., Waltham, Mass., U.S.A.

BENCH FILING MACHINE.

Twelve Things to Remember.—The value of time; the success of perseverance; the pleasure of working; the dignity of simplicity; the worth of character; the power of kindness; the influence of example; the obligation of duty; the wisdom of economy; the virtue of patience; the improvement of talent; the joy of originating.—Marshall Field.

THE TRANSMISSION PROBLEM.

THE rivalry between the different methods of power transmission reminds one of a very similar competition between naval gun makers and armor manufacturers. Electric transmission, even in its crude state, found many applications in which it proved superior to the line shaft drive. Makers of line shaft attachments, however, got busy, and produced roller and ball bearings, lubricating devices, etc. Belt makers and chain drive men are improving their products and simplifying the methods of application to reduce the cost and increase the safety of operation.

The motor drive has undisputed sway in many situations, particularly in connection with large machines and those whose use is intermittent. The belt drive still has many advantages in a more or less narrowing sphere and the newer chain drives are establishing themselves in fields where they cannot easily be superseded.

The more recent developments in available means of power transmission have made necessary particular study on the part of those intrusted with the devising of drives for different purposes and conditions. In fact the transmission problem is becoming more important and complex. It is one in which poor judgment may be the cause of very serious loss, and in which on the other hand, well advised installations will effect large savings.

AMERICAN COMPETITION.

A LARGE part of the labors of our legislators is periodically devoted to the revision of the tariff; this is for the purpose of fostering and protecting our infant industries—protecting them from the ravages of our competitive neighbors. If similar industries be owned in both countries by the same individual, he is doubly protected to the extent of the tariff, and can raise both selling prices just that amount.

Although it is true that our younger enterprises require fostering, American competition should not be made the goat for all conditions that cannot readily be explained in other ways. Competition is one of the greatest incentives to achieve, and the keener the rivalry the greater the perfection attained by both participants. Why is it that Australia with its climatic perfection and natural advantages is secondary in importance among the British Dominions? We have in Uncle Sam a worthy and most useful competitor. In such ways as we have so met him, our commercial conquests in other parts of the world have been made correspondingly and comparatively easy.

If we sift out from the vast work that Uncle Sam does for us, the actual cases where the possession of natural resources counts for more than unselfish personal effort on our part, there will be left a large measure the greater part of which we turn over to him as a prize for his unchallenged, aggressive competition instead of doing it at home ourselves. A more serious drawback than the efforts of our neighbor is the fact that foreign capitalists who invest in Canada, and our own financiers in particular, seem to expect higher dividends from their enterprises here than elsewhere, in spite of the fact that the capital investments are necessarily smaller.

There is no reason why many commodities cannot be as well manufactured in Canada as in the United States. This is borne out in statements by officials of some firms operating in both countries to the effect that some things can be made more cheaply in Canada. New enterprises are continually originating across the line in spite of the larger firms already and aggressively organized and with no tariff to protect them.

It is a significant fact that more patents have been issued per capita of population to Canadians than to any other people, and that the quality and extent of Canada's public works compare favorably with those of any nation. People talk about the great octopns of competition with our larger neighbor as something that will smother our efforts in the cradle and sap rather than stimulate our national vigor. It is for us to face this competition and to turn its influence to our account. To do otherwise would be to admit defeat before the battle has been fought.

INDUSTRIAL NOTABILITIES--No. 35

JAMES REID WILSON, one of Montreal's best known and highly respected business men, died in London, England on May 11, after a brief illness, of pneumonia.

Mr. Wilson was born in Glasgow, Scotland, about sixty-four years ago, arriving in Montreal at the age of twenty, and immediately entering upon that career which made him one of the most successful men of affairs of his generation. He was the son of the late John Wilson, who was M.P. for the division of Govan, now a suburb of the city of Glasgow, and one of the most prominent men of North Britain.

Entering the firm of Thomas Robertson & Co., iron and hardware merchants, Montreal, he, by sheer, hard work and business ability became its president, its largest stockholder and mainspring.

The great conflict between the Dominion Coal and Steel Companies, headed by Jas. Ross and J. H. Plummer, respectively, found Reid Wilson in the thickest of the fight, constituting with Mr. R. B. Angus and the then president of the Coal Company, the famous big three of that organization. When the Steel Company won out, Mr. Wilson

THE LATE JAMES REID WILSON.

accepted the inevitable and took office as vice-president of the Dominion Coal Co. and director of the Steel Corporation under Mr. J. H. Plummer.

Mr. Wilson, at the time of his death, was president and managing director of Thomas Robertson & Co., Ltd.; vice-president of the Dominion Coal Co.; chairman of the Canadian Board of the Phoenix Assurance Co., Ltd., of London, England; director of the Canadian Steel Foundries, the Dominion Steel Corporation, the Montreal Locomotive Works, the Montreal Trust Co., the Wayagamack Pulp and Paper Co., the E. A. Whitehead Co., etc.

He was a member of the Mount Royal, St. James, Forest and Stream, Royal Montreal Golf, and Royal St. Lawrence Yacht Clubs, and the Royal Thames Yacht Club, of London, England, and a member of the American Presbyterian Church.

In 1880 he married Miss Hallett, of Mobile, Ala., and is survived by his widow, two sons and two daughters; Mr. John Wilson, who is one of the directors of Thomas Robertson & Co., Mr. James Gemmill Wilson, Mrs. F. C. Shorey, all of Montreal, and Mrs. Robert G. Sare, of Halifax.

Mr. Wilson's remains will be brought to Montreal for interment.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., May 18, 1914.—In the machinery trade things are extremely quiet this week, though in other lines trade continues to slowly improve. Business men feel that the banks might now safely abandon their cautious attitude and "open up" a little with great advantage. As a local railway man put it a day or two ago: "The banks in their original scare over the real estate business were rather disposed to shut down on every sort of business, but they have found that this will not do. If that policy be pursued, then the statement of Sir Thomas Shaughnessy that the country is sound at the core could not be substantiated, for if the banks refused to help legitimate undertakings, the business of the country would collapse, and ruin would ensue. If a man wants accommodation and the banks say they won't give it to him, he has only one resource, and that is to 'bust,' and the banks can't afford to let any good legitimate business do so."

To-day sees the opening of the Goods Roads Congress, in connection with which an exhibition is being held at the Montreal Arena. Mussens, Ltd., occupy a large space, and are exhibiting stone-crushing machinery, concrete mixers, road rollers, portable engines, etc. Among other exhibitors are to be found the Canadian Fairbanks-Morse Co., London Concrete Machinery Co., Jones & Glassco, etc., etc. A number of prominent Canadian highway engineers, as well as others from Europe and the United States, are attending the congress, and some interesting papers are expected to be read.

Metals, etc.

The general condition of the metal market continues quiet. Canadian pig iron is down 25 cents this week, while English pig shows a rather firmer tendency; in fact, there may be a slight rise to report shortly. A number of inquiries for pig iron have been received, but so far few real orders have materialized. Last January and February foundries placed their orders covering their anticipated consumption till the end of June. Owing to bad trade most of them find they have enough pig on hand to last till September or October. Hence the quietness of the market.

Toronto, May 19, 1914.—Trade conditions, generally speaking, are about at the same level as have been prevailing during the past few weeks. The outlook is rather brighter, although any marked improvement can hardly be expected for some time. There has been a decided increase, locally, in the number of building permits issued, only a few, however, call for steel construction. Quite a number of municipalities are now inviting tenders for civic works and equipment, but how much of the work will be proceeded with this year is not certain. In some cases tenders are called for the purpose of making estimates for use on some future occasion. Until money is easier and loans can be floated at more reasonable rates, there will be little done in the way of municipal improvements.

Makers of railroad equipment, we are afraid, will have to continue to exercise a little patience with regard to the C. N. R. deal. It is likely that a decision will only be arrived at after a prolonged debate at Ottawa. It is reported that the Toronto Street Railway will be ordered by the Ontario Railway and Municipal Board, to build a large number of cars and in addition, lay several miles of track in new districts. The report of the Board has been completed but has not yet been submitted to the railway company. A transportation problem will probably be solved by a local real estate dealer, who, we understand, is proposing to inaugurate a motor-bus service for the purpose of carrying passengers to a suburban subdivision. The experiment will be watched with interest, as some experts claim that this type of vehicle is better suited than street cars for operating in and around cities, on account of their greater mobility.

The steel trade has not made any recovery after the recent decline, but there is a feeling in some quarters that a buying movement may take place next month, as stocks are light and consumers will be forced to come into the market. Prices on structural shapes remain at the same low level, which should be an inducement for consumers to take advantage of the market. The passing of the dividend on the common stock of the Dominion Steel Corporation was probably expected by many, but it will be a matter of general regret that the returns for the fiscal year show such a heavy decrease in net earnings, the decrease being $500,000.

No change can be reported in the pig iron market, business being still very dull. Small tonnages are the general rule and many foundries are operating at considerably below capacity. It is reported from the United States that there has been a further slight curtailment in the production of the blast furnaces.

The machinery market is still dull and little business is being done by local dealers. We understand that the C.P.R. have bought a punch and shears for the shops at North Bay, and that a firm of dealers report having sold a radial drill to the Gillson Co., Guelph.

Conditions in the metal market are looking brighter with a fair amount of business being done. Electrolytic copper has advanced ¼ cent and casting copper ½ cent a pound. Tin is weaker and has been marked down ½ cent, while lead is also slightly weaker.

Ottawa, Ont., May 18, 1914.—The session of Parliament which is drawing to a close has been marked by an unusual amount of minor legislation of more than ordinary importance to the business world. Such bills as the trust and loan companies acts, safeguarding the incorporation and running of such institutions, are examples. The bill to

prohibit deceptive advertising is another measure of this character. Another bill, affecting, of course, only the manufacturers of matches, was that prohibiting after the end of this year the use of white phosphorus in their manufacture.

Saturday, another bill of interest passed, that proposing to regulate the manufacture, testing, storage and importation of explosives. In recent years there has been great growth in the use of explosives, and their varied manufacture has become an important industry. There have been a number of serious accidents in Canada, and the new bill will provide greater safeguards.

This has indeed been a business session, and perhaps none for years has contained so many measures of importance to business, financial and commercial interests. The tariff was one of more than ordinary importance. This week or next at latest will see the close of the C. N. R. debate. The Government proposals have already been outlined and they will go through without serious objection, it is believed.

St. John, N.B., May 16, 1914.—The plant of the Maritime Cornmeal Mills in Erin street was almost totally destroyed by fire this week at a loss of about $6,000. The plant will be rebuilt, and it is probable that there will be an enlargement of the industry.

The Canada Wire & Nail Co., Ltd., a local manufacturing concern have made application to the city council for certain concessions in connection with their proposal to establish a plant for the manufacture of horseshoe nails on the site of the former Gordon Nail Works, West St. John. The company offered to lease the land for twenty-one years and asked for a limitation of taxes to an annual amount of $200 for ten years. An answer to the company's proposal has been promised for next week.

A visitor to St. John this week was W. Macdonald Mackintosh, a former resident of Liverpool, Eng., who is the inventor of a mixture which transforms fine quality silk goods or heavy duck into waterproof material. He has already formed a company for the manufacture of waterproof garments in the States, and proposes to do the same here, or in some other town in the Maritime Provinces. He was favorably disposed towards St. John, he said, but intended to look over certain other sites in Maritime cities before deciding as to where he would build his plant. He went to Halifax from St. John.

Another large pulp mill is to be erected in New Brunswick, in addition to the pulp and paper mill of the Bathurst Lumber Co., at Bathurst. The plant of the New Brunswick Pulp & Paper Co., at Millerton was closed down a few days ago pending a reorganization of the company and the rebuilding and re-equipment of the plant to enter the news-print field. The old company's creditors have been paid in full. J. L. McNichol, general manager of the company, said this week that London and New York capitalists were interested in the plant to quite an extent and it was planned to make it one of the most up-to-date and modern in Canada.

A delegation of local members of the Board of Trade returned home this week from Montreal, where they interviewed Sir Thomas Shaughnessy with regard to the possibilities of trade for St. John during the next winter. He told them that the facilities at St. John would have to be improved and he urged the delegation to exert its power to expedite wharf construction on the west side. While in Ottawa they interviewed members of the Cabinet.

W. Manning Doherty, general manager of the Maritime Dredging Co, made the statement this week upon his return from Montreal that the two new wharves which his company was constructing at Sand Point would be ready for steamers by December 1. The filling for the sites for the sheds will be completed by August 15, and the contracts can be let immediately. This would give plenty of time for shed erection.

Winnipeg, Man., May 18, 1914.—Reports from manufacturers, wholesalers and retailers in Winnipeg indicate that there is a steady, but moderate increase in the movements of merchandise. The outlook is considered favorable. It is expected that warmer weather will be followed by an active demand for goods to replenish stocks throughout the country.

Building permits continue to grow at a surprising rate in Winnipeg, and if builders and contractors can get all the money they require, there seems to be no doubt that there will be great building activity during the summer. It is said, however, that the volume of loans on city property this season to date is far short of the proportions that building permits indicate.

Money is reported fairly plentiful, but there is undoubtedly a tendency to place it cautiously, and most of the leading companies are quoting firm rates. The loaning of money on farm property is in moderate volume. There is a tendency to restrict speculation this year in practically all parts of the West. It is said that the farmers in some parts of the West have recently been paying mortgages in a satisfactory way.

Collections generally are not as good as the trade expected. There is a considerable demand for money for municipal improvements throughout these provinces, and it is said that several million dollars of bonds have been purchased.

Calgary, Alta., May 14, 1914.—Machine shops and manufacturers in Western Canada are buying tools and steel much more freely than they did three or four months ago. Whereas some plants were closed down at that time, the majority of them are now running full time, and while some are still working on stock, orders are coming in freely, and they are pretty sure of disposing of the stock they are making in the near future.

Those manufacturers who are able to supply tools, etc., and are willing to receive payment over a period of one or two years, are making big efforts to secure such business as is offering. Some of the large eastern houses are offering terms that two years ago would have been unthinkable, while others who have been "stung" on risky Western propositions are leaving business of this nature alone.

The representative of a Sheffield tool steel firm stated that there was no fault to find with that end of the business, he having had to cable to England four times in a very short period for extra supplies. Garages are buying much better, and several new plants scattered throughout Western Canada will be in the market soon for machinery equipment. A steel concern is proposed for Vancouver, backed by prominent financiers, and a firm manufacturing bakers' equipment will commence the erection of a plant there of considerable size in Vancouver shortly.

Building in Winnipeg is going ahead at a great pace, the value of permits having exceeded the five million mark, which is a record for the Prairie City. In Edmonton, which is one of the busiest cities in the West at the present moment, several large buildings are under construction. Considerable activity is also being displayed in the country north of Edmonton. In Calgary, building is not so brisk, though a large post office is going up.

E. Laurie Co., 240 Bleury St., Montreal, have been appointed agents of the Hare Engineering Co., for the Province of Quebec.

The Canadian Niagara Linens, Ltd., of Niagara Falls, Ont., have recently been incorporated with a capital of $300,000. The general manager is Mr. A. Fergusson Macintyre, formerly with the Montreal Cottons, Ltd., Valleyfield, Que. The mill will be approximately 208 ft. square, and it is expected that the machinery will be purchased early in July.

TRADE AND COMMERCE RECORD

Dealing With the Steps Being Taken and Progress Made by Industrial Canada To Achieve and Maintain a Dominant Place in the Markets of the World

$15,000,000 OIL PURCHASE.

PARTICULARS of a big oil merger which has just been closed by Earl Grey, as chairman of the Board of Directors of the British Union Oil Co., was announced a few days ago by Alexander Sclater, vice-president of the Union Oil Co. of California, on his arrival from San Francisco, via Victoria with his lordship, who is traveling incognito.

The British Oil Co., one of the largest oil corporations in the world, owning some of the principal oil concessions in Mexico, through Earl Grey has purchased the majority of the stock in the Union Oil Co. of California, a consideration of fifteen million dollars being involved in the transaction. This gives the British company control of some of the largest and most important oil wells in California in addition to its already considerable holdings.

The General Petroleum Co. of California has also been bought out by British interests represented by Earl Grey. Negotiations towards a big combination of forces have been in progress for some time and Earl Grey on his way across the Pacific on a world-girdling tour, visited California to look over the properties and consult with the heads of the Union Oil Co. before completing the deal.

NEW TECHNICAL SCHOOL FOR EDMONTON, ALTA.

THAT opportunities for technical education are needed equally as much on the south side of the river as they are on the north and that immediately these opportunities are provided the south side school containing them will be filled with students, was the information furnished members of the public school board by W. L. Richardson, Edmonton's director of technical training, at a meeting held on April 20.

It is proposed to use the old King Edward school on the south side for technical education purposes, and in accordance with a previous resolution, Mr. Richardson addressed the meeting concerning the proposed work, and the equipment required. The report was laid on the table to be further considered at the next session of the board, while Mr. Richardson was requested to submit a further statement as to the staff needed for this new branch.

Study Features.

(A)—Woodworking, joinery, cabinet making, carpentry and building construction.—Two rooms and a hall on ground floor.

(B)—Mechanical, machine and architectural drawing. — Assembly room, third floor.

(C)—Art and applied design, and clay modeling.—One room, third floor.

(D)—Sewing, dressmaking and millinery.—One room, second floor.

(E)—Cooking.—One room and office, second floor.

(F)—Bookkeeping, shorthand, and typewriting.—One room on second floor.

(G)—Gas engine and elementary electrotechnics.—One room in basement.

(H)—Academic work in both day and evening classes related to the occupations of technical and industrial workers. —One room on ground floor and one room on second floor.

Equipment Features.

The equipment required for the foregoing work will consist of:—

(A) — Sixteen cabinet maker's benches; one joiner; one universal saw bench; one band saw; one mortiser; one grinder; four pattern-maker's lathes and the necessary hand woodworking tools.

(B)—Twenty drafting tables, twenty stools, sixty drafting boards, twenty sets drafting instruments, twenty T-squares, twenty set squares, twenty scales.

(C)—Ten easels, ten stools, casts, etc.

(D)—Eight tables, twenty chairs, six sewing machines, one mirror, one dress form, one skirt marker.

(E)—Ten double cooking tables with cupboards and drawers underneath, twenty electric stoves, one coal range, one fireless cooker, one teacher's demonstration table, two supply cupboards, one refrigerator, twenty individual sets cooking utensils, additional cooking utensils for general use.

(F)—Ten typewriting machines, ten tables, ten chairs.

(G) Various types of modern gas engines and parts, elementary electricial apparatus.

(H)—Desks and seats for fifty pupils and the usual equipment of teachers' desks, chairs, bookcase, maps, etc.

It is expected that some of the apparatus will be loaned by various public-spirited business firms in the city for the purpose of demonstrating in the school, while the desks and seats are already in the school. Apart from these the equipment listed above would cost approximately $9,500.

WESTERN CONDITIONS SHOW IMPROVEMENT.

Mr. J. S. Dennis, assistant to the president of the Canadian Pacific Railway and head of the department of natural resources of that Company, on his arrival in Montreal from the west on May 16, said business both in the railway line and in the cities and towns of the west is quiet but improving owing to the fine spring and the early movement of people westward. It is now very generally recognized that following the extraordinary development experienced in all the Western provinces of Canada during the past few years, resulting as it has in the rapid growth of urban centres, there must naturally be a period of check in this class of growth until the settlement and development of the agricultural areas catch up. The inflated conditions of business and speculative dealing in real estate, which always accompanys rapid development in a new country, have now passed, and the progress which is being made is on sound lines.

DOMINION STEEL CORPORATION FIGURES.

NET earnings of $1,854,825, or, after deductions, slightly under 2¾ per cent. on the common stock is the outstanding feature of the annual statement of the Dominion Steel Corporation, the profit and loss account of which was made public on May 14. Net figures show a falling off of $517,842 from the level of the previous months ended March 31, 1913, a decline of 21.82 per cent., the earnings for year 1912-3 being $2,372,667, representing 4.3 per cent. on the outstanding common stock of corporation.

Net profits for the fiscal year ended March 31 are barely in excess of those at the same date in 1912, the increase over the latter period being a scant $19,656. A decrease in manufacturing profits of $272,026 from the level of the previous year, combined with an increase of $351,578 in bond interest requirements, are the chief factors in poorer showing.

New Financing.

New financing is responsible for heavier financial obligations in the latter respect. The showing in the main is distinctly disappointing. Although it was a matter of common knowledge that the Corporation's business was at a low ebb during the final quarter of the

year, it was generally thought earnings would show an equivalent to slightly less than four per cent.

Earnings for the first quarter of the year were well over 6 per cent., which shrank to 5.6 per cent. at the end of the third four-monthly period.

Statement in Detail.

The profit and loss statement issued to-day shows the following:

Manufacturing profits $4,442,031, less depreciation, etc., $903,889, and less bond interest and discount, $1,683,317, leave net earnings as $1,854,825. This added to balance April 1, 1913, of $883,012, less preferred dividend $980,000, less common dividends $960,931, leaves balance at balance March 31, 1914 of $796,907.

An allowance of $903,889 for sinking funds, exhaustion of materials and general depreciation compares with $1,009,660 in the previous year, or $105,761 less. A marked increase in interest charges which grew from $1,331,739 in 1912-3 to $1,683,317 last year, is of equal importance in showing poor business conditions under which the company operated.

INTERESTING POWERS GRANTED TO A COMPANY.

FEDERAL incorporation has been granted to a new Toronto company under the name of "Employers' Detective Ageney, Limited," with a capital stock of $100,000. The powers granted are decidedly interesting. The company may go into the business of obtaining and furnishing all kinds of information about individuals, corporations, etc.; it may enter into arrangements with governments or authorities, supreme municipal, local or otherwise, which may seem conducive to the company's objects, and it may remunerate any person for services rendered in assisting to place or guarantee securities or debentures, etc. The last-mentioned powers are interesting, in view of the strictures passed in Parliament by Messrs. Bennett and Nickle on the growing evils of the Parliamentary lobby.

AUSTRALIAN CABLE RATES REDUCED.

A GREATLY reduced cable rate for week-end messages, subject to slight delay, has been arranged between Canada and Australia and New Zealand. The announcement was made on May 16 by Hon. L. P. Pelletier, Postmaster-General, who has been negotiating with the British and Australasian postal authorities in connection with the proposals for a cheaper week-end rate over the State-owned cable.

The new rate, which goes into effect forthwith, provides for week-end messages from Canada to Australia and New Zealand at $2.80 for the first twenty words or less, and 14 cents for each additional word. The regular cable rate between points in Canada and Australia is now 58 cents per word. The new rate for deferred messages is only 14 cents. The week-end messages sent at the new rate may be subject to a delay of 24 to 48 hours, but the arrangement should be of material advantage to business men or others where a comparatively short delay will not matter.

NEED FOR PAUSE.

IN an editorial on "Railway Subsidies," on May 19, the London Times suggests that not much political importance should be attached to the outburst in Canada of hostility to the Canadian Northern contract. The giving of subsidies or guarantees is a sound method of facilitating the equipment of new countries with railways, provided the authority for granting them is really capable of making efficient investigations into the plans submitted and is free from improper influences.

In practice, Parliamentary bodies in new countries are not all that could be desired in either respect, but the errors are more often attributable to an excess of enthusiasm for rapid development than to sinister motives. Several of the Western Provinces, if not the Federal Government of Canada, have recently done rather more than was strictly prudent in this matter of railway guarantees, and it will not be a bad thing if the debates on the Canadian Northern subsidies should lead to a pause.

DOMINION STEEL REPORT.

THE serious decline in orders, and the consequent partial shutting down of the plants, coming at a time when all supplies had been laid in for an active winter's operations, have brought about a condition where we hold an excessive amount of raw and manufactured material, with a consequent increase in our current liabilities. The interest charges due with this, together with the charges on the entire cost of the new plant, which now falls on the earnings, but from which as a whole little benefit has yet been derived, have reduced the balance of earnings available for dividends."

In the foregoing paragraph, Mr. J. H. Plummer, president of the Dominion Steel Corporation, sums up the company's position in the annual report, which was mailed to shareholders a few days ago. With regard to current liabilities, the balance sheet accompanying the report shows a total of $6,005,965, as compared with $6,908,396 last year. Loans and accounts payable stand at $5,476,940, as compared with the corresponding total of $6,122,679 a year ago. On the side of current assets, there is a total of $9,527,568, as compared with $7,860,125 a year ago. That is to say, whereas there was a surplus of current assets over current liabilities of $951,729 last year, the surplus this year stands at $3,521,603, a difference of about $2,600,000. Inventories, as Mr. Plummer indicates, are up sharply, totaling $6,904,477, an increase of more than $1,900,000. Accounts receivable are about $375,000 lower, at $2,363,356.

In course of the report, Mr. Plummer says: "When the directors met you at the last annual meeting prosperous business for the year was confidently looked forward to, and for the first half of the year the expectations of your directors were realized. In the autumn a severe depression in the iron and steel business set in which affected your business for the rest of the year, and especially for the last quarter, most seriously."

Regarding plant additions, Mr. Plummer states that the expenditure incurred on the steel plant covered the completion of the extensions which have been in progress for some years. The directors have discontinued as far as possible all new expenditure of this kind, and on the steel plant it has for some time practically ceased. The capital expenditure of the subsidiaries last year amounted to $1,759,036, of which $1,123,599 was expended on the new collieries and other property improvement connected with the coal business, and the balance on the steel plant, mines and quarries.

Regarding manufacturing and business conditions, Mr. Plummer states that the dullness in the coal trade in the fall and winter months has not affected the prospects for the coming year. The normal output of coal will be maintained, and no decrease in sales and prices is expected.

FUNERAL OF WILLIAM WAINWRIGHT.

ONE of the most impressive funerals in the history of Montreal took place on May 18, when the remains of the late William Wainwright were laid to rest in Mount Royal Cemetery. The simplicity of the ceremony only added to the import of the occasion.

At two o'clock the Grand Trunk official family, which included not only the officials at headquarters, but those from many parts of the system, met at the Windsor Hotel and marched in twos to the family residence on Metcalfe Street. Thence at 2.30, when every wheel on the system had ceased for sixty seconds, the cortege proceeded to the Church of St. James the Apostle.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Hagersville, Ont.—Extensions to the hydro-electric system are being considered.

Biggar, Sask.—The town are in the market for a deep well pump and cast-iron pipe.

Vernon, B.C.—An electric light system will probably be installed at Peachland at a cost of $1,000.

Little Current, Ont.—A by-law will shortly be voted on to raise $12,000 for the installation of a power plant.

Aylmer, Que.—An electric pumping plant will probably be installed in connection with the waterworks system.

Grenfell, Sask.—Permission has been granted the Town Council to raise $6,500 for extensions to the electric light plant.

Renfrew, Ont.—The Hydro-Electric Commission have submitted a revised estimate for completing the lighting of the town. The total cost is estimated at $16,000.

Oshawa, Ont.—The Vanstone-Read Manufacturing Co., of Toronto, have bought the Stacey Factory here and will install machinery for making steel locks, hinges, etc.

Preston, Ont.—The Car and Coach Co. contemplate putting in a sprinkling system. Mr. D. M. Campbell, general manager, was in Toronto a few days ago looking into the merits of the "Silent Watch" system. By this system the fire is extinguished by chemicals.

Port Coquitlam, B.C.—Arrangements are now practically complete between a Vancouver syndicate of capitalists and the Coquitlam Terminal Co., for the establishment of a steel rolling mill in this city, the site for which is to be on Pitt river adjacent to the plant of the Coquitlam Shipbuilding and Marine Railway. Mr. Leon Melekov of Vancouver is interested.

Municipal

Tara, Ont.—The council will probably buy a fire engine.

Saskatoon, Sask.—The by-law for a fire alarm system which was recently turned down by the ratepayers will be voted on again on June 5.

Sarnia, Ont.—The City Council have decided to purchase a steam road roller at a cost of $2,800.

Edson, Alta.—The town will install an electric lighting and power system at an estimated cost of $45,000.

Coquitlam, B.C.—A waterworks system will probably be installed at the western section of the municipality.

Goderich, Ont.—The Town Council have decided to install a firm alarm system at an approximate cost of $1,000.

Galt, Ont.—Norman L. Wilson, inspector for the Fire Underwriters' Association, has reported in favor of enlarging the reservoir and increasing the water supply for the city.

TO WHOM IT MAY CONCERN.

The Canadian Kodak Company has decided to start work immediately on the erection of a new plant at Weston, Ont., where the company purchased a 24-acre lot last fall. The new plant will cost $1,500,000 and is planned to meet both English and Canadian demands, and to take advantage of the low British tariff on the raw materials the Eastman Co. needs. Seven buildings will be erected, with a floor space of 11 acres.

Windsor, Ont.—To give a better supply of natural gas the Windsor Gas Co., which supply the city, will co-operate to lay a new main from the fields at Tilbury at an estimated cost of $200,000. The pipes to be laid will be 18-inch and the length 22 miles.

Watford, Ont.—F. W. Thorold, consulting engineer, of Toronto, has submitted an estimate to the Town Council on the cost of installing a water works system. The estimated cost is $36,400, which includes a pump house, pumps, stand pipe and mains.

Saskatoon, Sask.—The ratepayers will vote on June 14 on a by-law to authorize the raising of $15,000 for a site for the proposed power house. The by-law was turned down on May 1, but a by-law for a power house was passed on that date. If the by-law is defeated a second time, the site will have to be purchased out of current funds, which at the present time is undesirable.

Transcona, Man.—A vote of the electors of Transcona will be taken May 23 on a by-law authorizing the Town Council to borrow $25,000 for the purpose of paying for the installation of an incinerator plant. On the same day also, the electors of Transcona will be asked to express their approval of a by-law authorizing the borrowing of $100,000 for installing a sewerage system. A third by-law will be presented for approval on this date, to empower the council to borrow $115,000 for installing a water works system and fire protection.

Owen Sound, Ont.—A special meeting of the Town Council took place on May 12, at which three industrial propositions were discussed and passed on to the ratepayers, who will vote on them on Saturday, June 6th. A dry dock and shipbuilding concern is to be given a bonus of $10,000 per year for twenty years. It is to construct a plant to cost $1,500,000, and to give employment to not less than two hundred men for at least eleven months in the year. This measure met with no opposition from the Council. The Union Cement Company gives the town a first mortgage on its plant and property, in return for which the town is to give a loan of sixty thousand dollars, to be repaid, principal and interest, in ten equal annual instalments. The concern is to employ sixty-five men for nine months in the year. The Canada Yeast Company has asked for exemption from taxes for a term of ten years.

General Industrial

Haileybury, Ont.—The Harris abattoir building was destroyed by fire recently. Loss $1,200.

Thamesville, Ont.—The Thamesville Canning Co. have sold their plant to the Thames Canning Co.

Stoney Creek, Ont.—It is reported that a company which is a large producer of fire clay in Ohio will establish a plant here.

Oakville, Ont.—It is reported that the basket factory has changed hands and that the new owners will make extensions to the plant.

Port Colborne, Ont.—The Niagara Feed and Seed Co. have commenced

work on the foundations for their new factory near the Government elevator.

Montreal, Que.—The city council has decided to purchase two motor patrol-wagons, one motor ambulance and three motor cars.

Medicine Hat, Alta.—It is reported that the Maple Leaf Milling Co. are making arrangements to begin construction next week on their new plant here.

Toronto, Ont.—It is announced that Mr. F. B. Robins will operate a service of motor 'buses from Yonge Street through a new sub-division to Bathurst Street.

St. Boniface, Man.—The Western Tire and Rubber Co. will probably build their new factory here instead of at Regina, as originally intended. The factory will cost $175,000.

Oak Point, Man.—A party of engineers have completed the survey of the spur to be put in about two miles north of here. A large plant for limestone and crushed stone will be installed.

Sutton, Que.—Clark Bros. have sold their tub making machinery in their factory here to the company at D'Israeli on the Q.C.R. and will give up making butter tubs when their present stock of spruce is worked up.

Estevan, Sask.—The Great West Brick and Coal Co. will proceed with the building of their kilns. The machinery will be supplied by the George E. Snowdon Co., of Hammond, Va., and by the J. D. Tate Machine Co., Plymouth, Ohio.

Ottawa Ont.—The Government has decided to locate in Victoria the new 72-inch reflecting telescope which is to be the largest in the world. It will cost around $200,000. Victoria has been selected because of its superior climate and its lengthened period of clear skies.

Sherbrooke, Que.—The J. H. Hamilton Shoe Co. by-law passed its third reading at the special meeting of the City Council recently. Under the provisions of the by-law the building is to cost not less than $20,000 and the plans and specifications are to be approved by the Council.

Regina, Sask.—The Board of Trade has announced that negotiations have been completed for the establishment in Regina of a red brick plant, which will turn out daily between 50,000 and 100,000 bricks, and employ from thirty-five to sixty men. It is expected that the plant will be in operation by July.

Redcliff, Alta.—The following local concerns have decided to open sales offices in Calgary and Edmonton, under the supervision of Mr. E. Byrnes:—The Redcliff Ornamental Iron Works, Redcliff Pressed Brick Co., Redcliff Rolling Mills and Bolt Foundry, Redcliff Motors Co., and the H. Kelly Co., of Minneapolis.

Sherbrooke, Que.—Three by-laws will be submitted to the ratepayers on May 26, namely, the J. H. Hamilton by-law providing a bonus for the proposed shoe factory; the Canadian Rand by-law providing for a fixed valuation of $100,000 for municipal purposes; the C. P. R. by-law providing for a fixed valuation of $50,000.

Embro, Ont.—Libby & McNeill, of Chicago, a subsidiary of the Swift Company, are considering the establishment of a branch plant here. Representatives of the big firm have been in the village, and the Board of Trade is hopeful of securing the industry. The oatmeal mills, formerly operated by D. R. Ross and the Cereal Milling Co., may be purchased for the purpose.

Stratford, Ont.—Of four by-laws voted upon by the ratepayers on May 18, three were carried. The fire apparatus measure, asking $17,250 for new fire equipment, which is badly needed, was defeated, the vote being 454 for and 622 against. In connection with this by-law a question was submitted as to the ratepayers' preference for motor-driven or horse-drawn apparatus, and the answer was: For horses, 470; for motors, 461. The by-law to provide $11,500 for an incinerator as the disposal feature of the proposed garbage removal system was the most strongly indorsed of all, being carried by 604 to 476, a majority of 128. By 574 to 505, the citizens voted $22,000 to install nitrogen-filled lamps on iron poles in the business centre of the city, and extend the present lighting facilities into the outskirts. The third successful by-law provides $10,000 to complete the Agricultural and Athletic Park by adding stables, fences and track. A very light vote was polled, there being no organized effort to get the citizens to the polls.

Trade Gossip

The Frick Co., Waynesboro, Pa., have supplied a 10-ton vertical refrigerating machine and brine cooling system for the Earnescliffe Apartments, Toronto, Ont.

The Frick Co., Waynesboro, Pa., have supplied to the order of Keiths, Ltd., Toronto, a 15-ton vertical refrigerating machine and compression system with brine cooling apparatus.

Shops Slow Down.—After working on a 55-hour a week basis for several weeks in making repairs to locomotives, the machine shops of the Pennsylvania Railroad at Altoona have resumed the 40-hour a week basis.

Overtime in Hamilton Factories. — Several of the large manufacturing concerns in the east end of Hamilton, have started to work overtime. The officials of the Steel Co. of Canada, report that business is picking up, and they expect to have their plant working at full capacity again soon. The Canadian Westinghouse Co. also reports improved conditions.

The Wells Bros. Co. of Canada, Ltd., have taken over the business formerly carried on by the Canadian Tap & Die Co. at Galt, Ont., the local management remaining as before. This step has been taken to prevent confusion among customers over tools bearing the trade mark "Little Giant," which have heretofore been made in the United States by Wells Bros. Co., and in Canada by the Canada Tap & Die Co.

April Fire Losses.—The fire loss of the United Etates and Canada for the month of April, as compiled by the New York Journal of Commerce, shows a total of $17,700,800. The following table affords a comparison of the losses by months this year with those of the same months in 1913 and 1912, together with the monthly record for the balance of those years:—

	1912.	1913.	1914.
Jan.	$35,653,150	$20,193,250	$23,204,700
Feb	28,601,650	22,084,600	21,744,200
Mar.	16,650,850	17,511,000	25,512,750
Apr.	16,349,400	16,738,250	17,700,800
Tot.	$97,255,050	$76,528,100	$88,162,450

Refrigeration

Medicine Hat, Alta. — The Medicine Hat Pure Ice Co., recently organized is we understand, preparing to erect a 50-ton ice making plant.

Hagersville, Ont. — C. W. Kaufman has had his creamery equipped with a 4-ton refrigerating machine furnished by the York Mfg. Co., York, Pa.

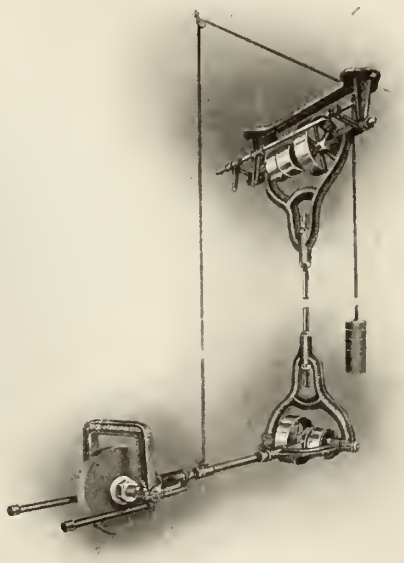
Victoria, B.C. — The Brentwood Bay Hotel Co. are having their hotel equipped with a 2-ton refrigerating machine, furnished by the Triumph Ice Making Co., Cincinnati, O.

Regina, Sask.—It is reported that Alex. Harrison of Minneapolis will erect an ice factory and cold storage plant here this summer. The plant will cost approximately $50,000.

Brantford, Ont. — Ryerson Bros., wholesale grocers and produce merch-

The Ford-Smith Machine Company

Heavy Type Self-Oiling Floor Grinder.
Stock sizes 6" up to 30" emery wheels.



Built for Continuous Heavy Duty

A study of these pictures will convince you we are building grinders in advance of the usual run.

Ford-Smith service in the grinder department has begun to mean something in very many up-to-date shops both large and small.

Besides all types and sizes of grinders and polishers, either belt or motor-driven, we manufacture safety collars, guards, etc.; in fact, **for anything pertaining to grinding, write us.**

Heavy Type Swing Grinder and Polisher.
2 sizes, 16" and 20" wheels.

The Ford-Smith Machine Company, Hamilton, Ont.

ants, have installed a 4-ton vertical refrigerating machine furnished by the York Mfg. Co., York, Pa.

Collingwood, Ont. — T. Long & Co., Ltd., wholesale produce merchants, have equipped their cold storage warehouse with a 17-ton refrigerating machine, furnished by the York Mfg. Co., York, Pa.

Saskatoon, Sask.—The Saskatchewan Co-operative Abattoir & Cold Storage Co., has been organized to establish an abattoir and also a cold storage warehouse, a Government subsidy for which has been requested.

Hays Port, B.C.—The Skeena River Fisheries, it is reported will build an addition to its cold storage plant at a cost of about $50,000. The plant now has a cold storage capacity of about 2,000,000 pounds.

Kingston, Ont.—J. Y. Parkhill & Co., Ltd., dealers in groceries and produce, have fitted up cold storage rooms and installed a 4-ton refrigerating machine furnished by the York Mfg. Co., York, Pa.

Edmonton, Alta. — The New Grand Trunk Pacific Hotel is being equipped with a 20-ton refrigerating machine and a 3-ton ice making system, machinery for which was furnished by the Triumph Ice Machine Co., Cincinnati, O.

Catalogues

Boiler Cleaning Logic.—A pamphlet devoted to the treatment of external surfaces of steam boilers and published by the Bayer Steam Soot Blower Co., St. Louis, Mo., has reached us. The "Bayer" soot blower system is described fully and its application clearly shown by means of a number of illustrations. The pamphlet also contains several copies of testimonials and partial list of users.

Reducing Valve and Pump Governor.—Bulletin No. 9, issued by the C. A. Dunham Co., Toronto, deals with the "Fisher" reducing pressure valve and vacuum pump governor. A comprehensive description is given of these fittings, with tables giving the weight, price and code word for each size. Diagrams are included for each fitting, with the name of each part given, while one table gives the principal dimensions for each size of pressure-reducing valve.

The Bayer Feed Water Purifier is treated at length in an attractive bulletin sent to us by the Bayer Steam Soot Blower Co., St. Louis, Mo. The feed water problem is discussed and the claims for the "Bayer" purifier set forth, followed by a complete description of this apparatus. One page is devoted to boiler troubles, their causes and remedies. Tables of evaporation and coal consumption are also included. The bulletin is fully illustrated to show the application of the "Bayer" purifier.

The Electric Storage Battery Co., Philadelphia, Pa., have issued hand-book HL, descriptive of low voltage isolated electric plants for lighting and power with chloride accumulators. Particulars are given of the plant and system, with illustrations of switchboards and wiring diagrams. A complete list of equipment and material contained in each plant, including the accumulators, is also given, with price list, capacity and shipping weights. Copies may be obtained from the Canadian General Electric Co., Ltd., Toronto.

Chloride Accumulators, made by the Electric Storage Battery Co., Philadelphia, Pa., are described fully in handbook 1P sent us by the Canadian General Electric Co., Toronto. The accumulators dealt with in this catalogue are for use in 110 volt isolated power plants only, those of higher voltage being listed in other catalogues. The different types are dealt with separately, and a complete list of material contained in each equipment is given, together with prices, capacity and shipping weights. A number of switchboard specifications are included with diagrams showing connections.

ASSOCIATION AND PERSONAL

A Weekly Record of Current Association News and of Individuals Who Have Been More or Less Prominent in Machinery Circles

Paul Mercier has been appointed assistant to the chief engineer of Montreal at a salary of $5,000.

R. S. Lea, of Montreal, has been appointed consulting engineer of the municipality of Fort Garry, Man.

Hon. F. D. Monk, former Minister of Public Works, in the Dominion Cabinet, died at Montreal, on May 15, aged 58.

R. E. Armstrong has been appointed secretary of the Board of Trade, and industrial commissioner for St. John, N.B.

Cyrus A. Birge, vice-president of the Steel Company of Canada, has been elected vice-president of the Bank of Hamilton.

L. M. Wood has been appointed president of the Standard Chemical, Iron & Lumber Co., to succeed Colonel A. G. Peuchen, resigned.

William McNab, principal assistant engineer of the Grand Trunk Railway System, has been elected president of the Canadian Railway Club, Montreal.

Oscar Mueller, president of the Mueller Mfg. Co., Sarnia, Ont., was elected president of the American Waterworks Association at the recent meeting in Philadelphia.

Captain Andrew Rattray died at Detroit, Mich., on May 9, aged 72. Captain Rattray was until his retirement two years ago, in the service of the Detroit & Windsor Ferry Co.

B. W. Greer has been appointed agent for British Columbia for the Maple Leaf line of steamers, which ply between New York and Vancouver. His headquarters will be Vancouver.

Captain Andrew Baird died at his home in Toronto on May 12, aged 80. Captain Baird was at one time one of the best known captains on the Great Lakes, but retired 20 years ago.

George Kidd, of Vancouver, has been appointed general manager of the British Columbia Electric Railway in place of R. H. Sperling, who goes to London to be assistant to the chairman of the Board of Directors.

Alexander B. Scully, president Scully Steel & Iron Co., died May 7 at his home in Chicago, aged 58 years. He was born in Chicago, and in 1891 formed the Scully-Castle Co., which later became the Scully Steel & Iron Co., of which company he was president up to the time of his death.

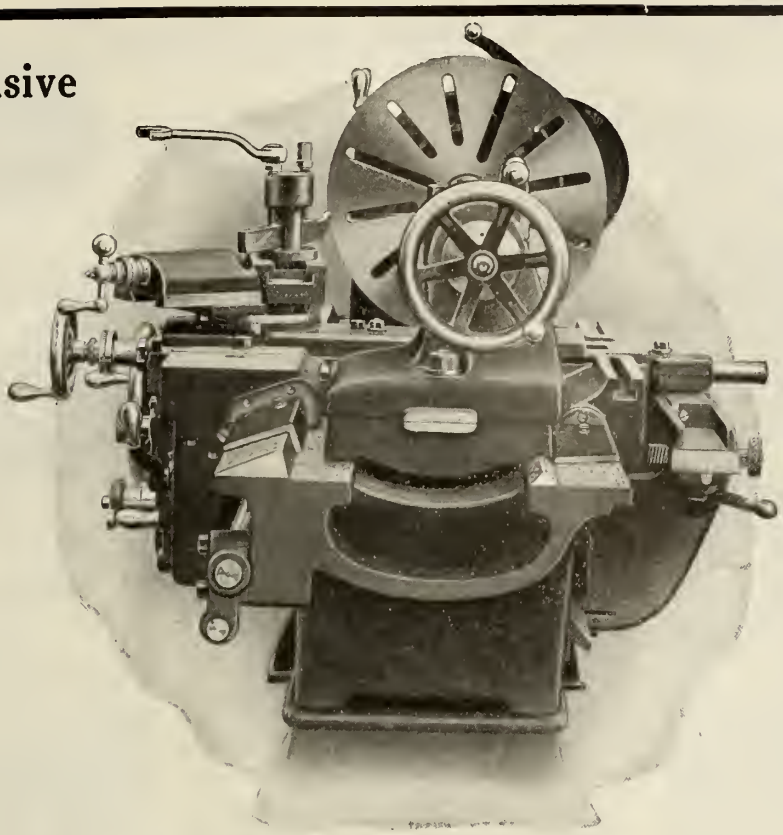
Dr. Paul Louis Toussaint Héroult, a pioneer in the electrometallurgy of aluminum and steel, died in France, May 9, from an attack of typhoid fever. While he had not enjoyed good health for some time, his death at the age of fifty-one was hardly expected.

Admiral Sir Charles Carter Drury, G.C.B., G.C.V.O., K.C.S.I., F.R.G.S., who was Second Sea Lord of the British Admiralty from 1903 to 1908, died on May 18. Sir Charles, who was born at Rothsay, New Brunswick, in 1846, was educated at the Collegiate School, Fredericton, N.B. He entered the Royal Navy in 1859, and became an Admiral in 1908. He was Commander-in-Chief at the Nore, 1908-1911, when he retired from the active list.

William Wainwright, senior vice-president of the Grand Trunk and Grand Trunk Pacific Railways, died at Atlantic City on May 14. Mr. Wainwright was born in England in 1840, and came to Canada in 1862, when he entered the service of the Grand Trunk Railway, and remained with the company until his decease.

F. P. Gutelius, general manager of Government railways, was hurt on May 14, in Montreal, by falling from a street car whilst on his way to the station to catch the 7.30 I.C.R. Ocean Limited. He attempted to board a car, and failing to get proper hold, was dragged several yards, sustaining painful injuries to the face. He was taken to the General Hospital, where it was stated he would have to remain several days. His injuries though painful, are not severe.

Canadian Electrical Association Convention.—The annual convention of the Canadian Electrical Association will be held this year in Montreal on June 24, 25 and 26. The headquarters of the convention will be in the new club rooms of the Canadian Society of Civil Engineers, Mansfield street. At a recent meeting of the executive branch, committees were formed including a convention committee of Montreal men, a committee in Toronto to co-operate with them, a papers committee, etc.



Edmonton Branch, Can. Soc. C. E.—On May 1 an Edmonton branch of the Canadian Society of Civil Engineers was formed, with headquarters at the University of Alberta. Fortnightly meetings will be held. The following are the officers elected for the ensuing year:—Chairman, W. Muir Edwards, M.Sc., C.E., Professor of Civil Engineering, University of Alberta; secretary-treasurer, L. B. Elliott, Department of Public Works, Canada. Executive Committee—Commissioner of Works, J. Chalmers; W. R. Smith, N. M. Thornton, D. J. Carter, J. D. Robertson, and R. H. Parsons.

Wilson B. Chisholm, president Champion Rivet Co., Cleveland, Ohio, died May 10, aged 65 years. He had been in poor health for a number of years, following a stroke of apoplexy, and during that time had practically retired from active business. He was born in Montreal, Canada, and when a boy his father, Henry Chisholm, moved to Cleveland. The latter was one of the founders of the Cleveland Rolling Mill Company, of which his son, Wilson B., was vice-president and manager for about 15 years. He was also interested in the Chisholm & Moore Mfg. Co., Cleveland, of which his brother, S. H., is president.

J. E. Rogers, until recently assistant general sales manager of the National Cash Register Company at Dayton, O., joins the Russell Motor Car Co., as assistant general manager. Mr. Rogers will also be elected to the directorship made vacant recently by the death of the late Senator Cox, and becomes second vice-president of the company. Mr. Rogers is a Canadian, born at Barrie, Ont. Previous to joining the National Cash Register Co., he was on the staff of the Canada Cycle & Motor Co., in charge of their Toronto retail branch, and before that time represented the Gould Bicycle Co. in the Maritime Provinces. He assumes his new duties at once.

Col. H. N. Ruttan, who has been for many years city engineer of Winnipeg, will, we understand, be relieved of his duties on June 1. Col. Ruttan's resignation has not been entirely unexpected: in fact, it was intimated last year that he contemplated resigning at an early date. The death of R. D. Willson, assistant city engineer, delayed the matter, however, and he was induced to continue in office for some time longer. Col. Ruttan is not completely severing his connection with the city, it being understood that he will be retained as consulting engineer at a salary approximating that which he receives as city engineer.

Book Reviews

Tide Tables for the Pacific and eastern coasts of Canada for 1914 have been issued by the Tidal and Current Survey in the Department of the Naval Service of the Dominion. The bulletins contain tide tables for various points on each coast, and in addition a considerable amount of information on tides and currents.

Report of the Secretary of Industries and Immigration for the Province of Nova Scotia.—The report contains an account of the work carried on by the Department for the year ending September 30, 1913. The operations of the Department in securing immigrants and particulars of farming districts are described, and are accompanied by tables giving some interesting statistics. The report is fully illustrated.

Coal-Mine Fatalities in the United States during March, 1914, are the subject of a monthly statement issued by the Bureau of Mines, Department of the Interior, Washington, D.C. The tables give the number of men killed in or about coal mines in the United States for the first three months of this year, with the fatalities classified according to cause. The number of fatalities for each State are also given in the tables.

Drilling Wells in Oklahoma by the mud-laden fluid method is the title of technical paper 68, recently issued by the Bureau of Mines, Department of the Interior, Washington, D.C. This paper records the experience of the investigators in introducing a method of drilling that is not attended by the waste of gas that often accompanies the usual method. The necessity for an investigation was on account of the great waste of natural gas that occurred when drilling for oil, and the Government's desire to prevent the waste.

The Express Service and Rates by W. H. Chandler, Assistant Manager, Traffic Bureau, The Merchants' Association of New York, with appendix of test questions, and numerous tables and charts. 340 pages; published by the La Salle Extension University, Chicago. Mr. Chandler, in his treatise on "The Express Service and Rates," presents a work of timely and lively public interest. The vast field of express service has, strange to say, never been adequately treated. Stimson's "Express History" treats of the historical side, but it is now out of date. Various works on transportation devote short chapters to express service, but there has never been an adequate treatment. This fact, even if there were no other reasons for interest in Mr. Chandler's treatise, just published by the La Salle Extension University, Chicago, should make this carefully prepared manual noteworthy. There are, however, other reasons. On February first of this year the new express rates went into effect. The Interstate Commerce Commission's activity, the parcel post competition, and other events, are directing popular interest to this subject. Furthermore, the recent announcement that the United States Express Co. is to discontinue brings another reason for popular interest. It is interesting to note, in this connection, the following, concerning the United States Express Co., from the chapter on "Internal Organization of Express Companies" of Mr. Chandler's book:—"The United States Express Co. is a joint-stock association or partnership composed of persons associated together to do express business each with full partnership liability for the company's obligations. It was organized April 22, 1854, in the State of New York, for a term of ten years, which term has been several times extended. At the time of the organization of the United States Express Co. the ownership was divided into 5,000 interests. From time to time and down to March, 1876, the number of interests was increased, until at the last mentioned date the ownership was divided into 70,000

Classified Advertisements

¶ Those who wish to sell or buy a business, obtain competent help, connect with satisfactory positions, or secure aid in starting new enterprises should not fail to use the Want Ad. Page of "CANADIAN MACHINERY."

¶ If you want to sell or buy a second-hand lathe, planer or any other shop equipment, let "CANADIAN MACHINERY" pick out a seller or buyer for you. How about that second-hand engine or boiler which you would like to dispose of?

¶ "CANADIAN MACHINERY" is the central market place of the machinery trades throughout Canada.

¶ There is always some one looking for just such a proposition as you have to offer.

Rates (payable in advance):—2c per word first insertion, 1c per word subsequent insertion, 5c additional each insertion when Box Number is required. Each figure counts as one word.

BUSINESS OPPORTUNITIES

SPLENDID PAYING BUSINESS READY for reliable, intelligent man over thirty years old, to take hold of as district agent. Large corporation. Products extensively advertised. Thousands use and endorse. IRON FOUNDRY AND PLANT: PATTERNS of 43 years' accumulation, including the best line of stoves in the Maritime Provinces. P.O. Box 522, Yarmouth, N.S. tf

interests. During the month of September, 1887, 15,000 interests were sold for $1,000,000, which sum was at that time paid into the treasury of the company." The new publication is more a practical than a scholarly effort, though no objection can be brought against it on that score. It covers the whole express field, from history, organization, and service to rates and classification. Express statistics and finance are subjects carefully treated, and both the old and the new rate-making systems are fully explained. This is of especial interest since the rates are lowered considerably. The relation to the parcel post is also carefully discussed. Express forms, commodity rates, and all the details of the express work that a man who makes this his life work wants to know are practically discussed. Dozens of pages are given over to the actual reproduction of express material, such as classification, documents, contracts, receipts, directories, and schedules. Although most of the treatise is devoted to American express service, there are chapters devoted to Canadian express service and foreign service. The work should be very helpful to the occasional express shipper, as well as to the student of transportation. It forms a part of a series of similar treatises which serve as a basis for the course by correspondence in Interstate Commerce and Railway Traffic given by the La Salle Extension University, Chicago.

Redcliff, Alta.—It is reported that a concern, known as the Premier Glass Co., is contemplating starting a plant here.

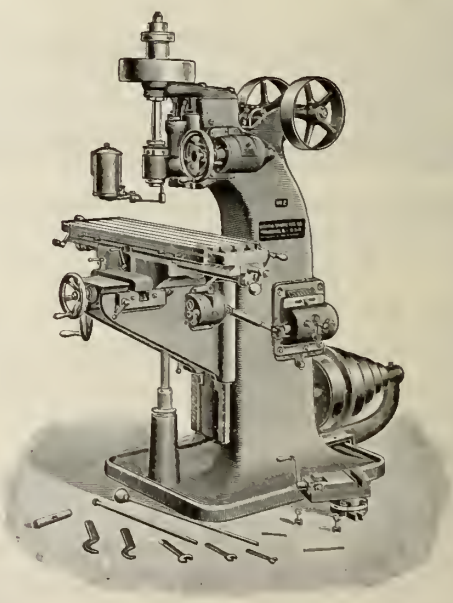
Spindle Speeds Up to 1000 Revolutions per Minute Meet the Demands of Drilling, Die Sinking and Similar Work



This feature of the No. 1 Vertical Spindle Milling Machine makes it a valuable addition to the equipment of any tool room, especially those doing a large amount of recessed work on dies, jigs, and similar tools. By the use of a High-Speed Milling Attachment a large variety of much faster speeds than those given above is available. Special attention is called to the simplicity and convenience of this machine.

THE SPINDLE HEAD IS EASILY OPERATED AND ADJUSTED

The spindle head has a vertical movement, with fine hand feed and a quick return operated by the same hand wheel, often serving the purpose of a drill press on work already in position for milling. Micrometer stop on the head controls the amount of movement.

This is just the machine to complete the equipment of your shop.

Send for a special circular giving full specifications.

Ultimately

you will give your employees an individual place to keep their clothes, lunch, etc., because when you investigate you'll find it will save you money and make for better workpeople. Ultimately you will install steel lockers for this purpose, because they are cheaper and better than any other kind. Ultimately you will install the steel lockers that are made in the largest, most efficient plant of its kind in Canada. These lockers are built accurately by skilled mechanics of the best suitable materials; they are everything a locker should be—they are called—

DENNISTEEL
FACTORY LOCKERS

Complete information is free. It's interesting. Send a postal now, while you think of it.

CASTINGS

ALL CASTINGS GUARANTEED TO YOUR APPROVAL

Electric Steel Castings

OUR Welland Plant will be ready to furnish Carbon, Manganese, Alloy Steel Castings and Forging Ingots, by the end of May, made by the Electric Furnace process.

This Process makes a dependable high-grade Steel and Steel Castings, a tough, homogeneous material, free from blow-holes, and having a remarkable resistance to fatigue. Write us for prices and particulars.

THE ELECTRIC STEEL & METALS CO., LTD.
Welland, Ontario

John Wanamaker says that advertising doesn't jerk — it PULLS. He ought to know, and yet some men think that advertising should go against all rules and precedents and jerk them to success with one tremendous yank.

NICHOLSON MADE

THE FILE

THAT MADE "THE FLYER" A FACT

Without a file to smooth the rough edges, the "Mogul" and the "Greyhound" would be mere dreams.

The file has made the "Flyer" a Fact.

And a tour of the shops will convince you that the file was a

NICHOLSON-Made-FILE

Not only the greatest railway shops and shipyards in Canada and the United States—but even the Government railroads of far-off India—are among the largest individual consumers of NICHOLSON-Made-FILES.

And in the interest of economy and efficiency, they are learning to use **two** files where they heretofore only used **one.**

The many advantages of the **"use more files"** plan is best displayed by a test in your shops. It will pay well to try it to-day with

Nicholson-Made-Files

Brands

Kearney & Foot **Great Western**
American **Arcade** **Globe**

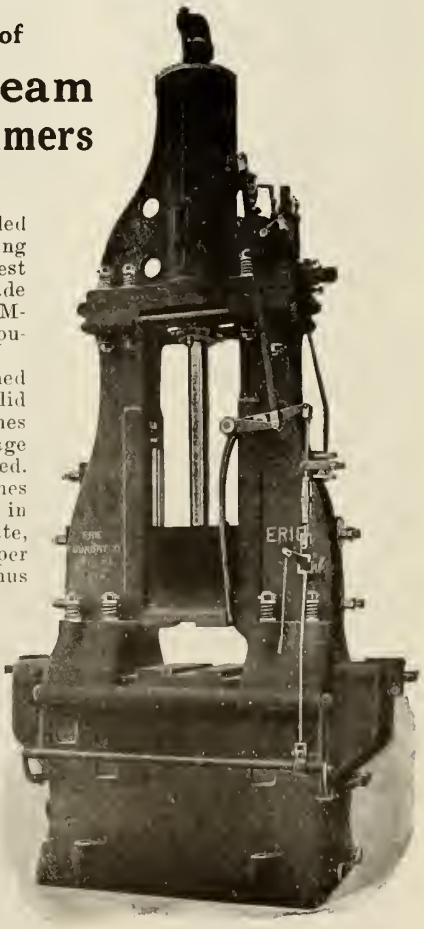
The YOST

Solid Jaw and Swivel Bottom Machinist's Vise

MADE IN CANADA.

A vise with a grip like grim death; a durability that defies time and the hardest usage.
A vise that will give you a lifetime of perfect service and satisfaction. The metal in a Yost Vise is of faultless quality, perfectly distributed and the workmanship is

Incomparably Good



The National catalog would certainly interest you. Write us, asking for a copy.

National Machinery & Supply Co., Ltd.
HAMILTON - - ONTARIO

This Guarantee Goes With Every Vise: We fully guarantee all of our Vises to be satisfactory in every particular and will promptly replace, without cost, any parts broken or badly worn when such failures are due to faulty material or construction.

The construction of
"Erie" Steam Drop Hammers
is different.

That difference, coupled with sound engineering ability and the very best of materials, has made for "ERIE" HAMMERS an enviable reputation.
The Guides are designed so that they have a solid backing in the Frames the full length. Breakage is positively eliminated. The Cylinder and Frames are securely held in place by a steel tie plate, making the entire upper works as a unit, thus assuring accurate forgings.
Would you like to know other strong points of the "ERIE" construction? Send for catalogs.

get *full* value

Every line of type in Canadian Machinery is printed for a distinct purpose—SERVICE.

In no feature of this journal is the idea of service more notable than in the advertising. The constant study of shrewd advertisers is how to be of most service to you.

The more the advertising may be made to pay YOU—the better will it pay the advertiser.

You are not getting the fullest benefits from this journal unless you are a constant and careful reader of its advertising pages.

There is no feature more helpful—more important—more interesting.

Why not secure to-day the educative and personal benefits of your paper by keeping in intimate touch with advertising sections?

Look it over NOW—while you think of it.

The advertiser would like to know where you saw his advertisement—tell him.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

Books for Foundrymen

Three good Books that should interest Foundrymen who wish to know more about their work.

PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price $1.00

FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price, ... $1.00

PATTERN MAKING. By G. H. Willard. To which are added chapters on Coremaking and Molding. 214 pp., 312 illustrations. Cloth binding Dealing with the practical experience of foundry work, tools required; woods adapted for the work; turning: and all kinds of patterns. Price, postpaid .. $1.10

The Most Essential Difference in Wilt Twist Drills is Found in the Process by Which They Are Made

Instead of six or seven separate processes which have been necessary heretofore, Wilt Drills are machined complete at a single chucking. The rough stock goes into the automatic machine and comes out a perfectly cut drill.

You can readily understand what that means in accuracy and uniformity.

Because of the perfect machining—and the scientific exactness with which they are hardened, Wilt Drills will drill more holes of a given size, per dollar of cost, than any other drills ever made.

Prove this statement — Try Wilt Drills on your hardest job.

If your supply dealer doesn't have them, write direct.

The Tap with the Con-eccentric Land for Tapping Nuts

One-third of the land from the cutting edge is concentric. The remaining two-thirds has eccentric relief.

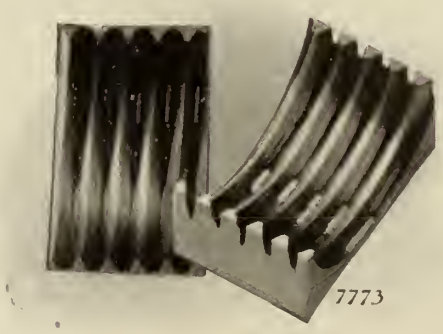
TO show more clearly the free-cutting qualities of these taps, a nut slightly smaller than one and one-quarter inches square was drilled for tapping and held lightly by the corners. The nut was then tapped with a 1¼-7 U. S. S. con-eccentric tap, driven through without reversing. (See cut on right).

So perfect were the cutting qualities and so easily and freely was the work done that this mere shell of a nut was not **even distorted**, to say nothing of being split as would have happened with a tap differently constructed.

Consider what this means to the nut manufacturer from the standpoint of a **saving in power.** This is but one reason why Pratt & Whitney taps are specified by the largest nut manufacturers in the country.

TAPS can be sharpened at the only correct point—on the face of the cutting edge.

Sharpening in no way affects their size.



Can be sharpened long after other so-called eccentrically - relieved taps are rendered useless.

We obtain the freest cutting tap with the longest life — an exclusive combination.

Accuracy nowhere else obtainable is secured together with a degree of finish and refinement heretofore thought impossible in a commercial tool.

For a number of years we have made taps with this style of relief. They have won out steadily and consistently on merit alone. We want tap users to know *why Pratt & Whitney taps are best,* also that our claims are based on reasons mechanically correct.

Write for our booklet "The Tap with the Con-eccentric Land."

Cut to left is a tapped nut sawed in half showing small area of metal which held it together.

The taps are carried in stock by our Branch Offices and Agencies throughout the world. Prompt service assured to all customers wherever located.

Pratt & Whitney Co. of Canada, Ltd., Dundas, Ont.

Ever unscrew a nut with a chisel?

When it's nicely rusted up, and stuck away in some corner where you can't get a big wrench on it to save your neck. Then it is that you have to recourse to a chisel, and collect a bunch of raw knuckles before you have that nut adrift.

The

Bemis & Call Adjustable "S" Nut Wrench.

would have saved your knuckles and got that nut off at the same time. Its large diameter operating nut allows you to "feel" for the bolt and adjust the wrench with one hand. Its sturdy construction means long life; its interchangeable method of manufacture means easy replacements.

KEMPSMITH

No. 3 Universal

This No. 3 Universal Miller is an exceedingly versatile machine. It is adapted not only to the highly accurate work of the tool-room, but also to the demands of the Manufacturing Department, where capacity, rigidity, and maximum output are required.

It is furnished with wide step cone and double back gears, giving ample pulling power.

An indestructible fool-proof gear-box gives 16 quick changes of feed while machine is operating under cut.

All feeds are reversed and tripped from the extreme front of the knee.

The machine is guaranteed as to accuracy within very close limits.

It is furnished with one of our rigid, compact, highly accurate dividing heads with side centre tailstock.

Send us your inquiries when you are in the market for a high-grade milling machine.

Hendey Geared Head Lathe

WITH BELTED MOTOR DRIVE

Hendey Lathes are the standard of accuracy. They mean practical economy in every tool room in which they are in operation.

In many cases it has not been found necessary to supply motor of sufficient power to meet maximum capacity of lathes. With this in our minds we have designed this **Belted Motor Drive attachment** and offered it as a **low-cost motor drive.**

The work being light in character makes it convenient to use a motor of moderate power and belt for transmission in place of chain and sprocket. Motor is mounted on a hinged plate, which affords a means of securing necessary belt tension. Friction clutch control in pulley on power shaft is furnished in all cases, and belt guard is also supplied when desired. Controlling panel, as shown, is comparatively small in size, and can therefore be attached in front of motor, where it is convenient to handle it. Drum type controller can be furnished in place of panel if preferred, and which would be attached to bed and leg, directly below head stock, in a vertical position, within easy reach of operator. Motors for this type of drive can be direct or alternating current, constant or variable speed.

The Hendey Machine Company

MOST POWERFUL MILLING MACHINE

(Knee Type)

GARVIN No. 22, Plain Milling Machine, Compound-Geared. Use Code, "Aperient"

The machine shown is the most powerful Knee Type Milling Machine manufactured by us, having Compound Back Gearing whose ratio is 10 to 1, through steel gears. It will transmit 10 horsepower to 14-inch cutters, running 20 revolutions on steel castings. The machine has a wide-faced pulley of 11 inches in diameter, running loose on the spindle. The power is taken from the countershaft by a 6-inch double belt to this pulley and double-backed-geared back to the spindle. The machine has an arbor 2 inches in diameter, solid, with spindle, thus avoiding a lot of arbor troubles.

DIMENSIONS

Length of automatic feed of table	28 in.
Dimensions inside of oil pockets	43½x9 in.
Vertical adjustment	15½ in.
In and out adjustment	7 in.
Crated weight	3250 lbs.

The Drill That Came Back
and why—

"Detroit" Twist Drill

452

Just the other day, the Western-Mott Company, one of the largest manufacturers of automobile axles, rims and hubs in the country, wrote us saying:—

"We have sent you one 21/32" Drill for inspection and test. This drill was taken out of stock, and drilled 206 knuckles 4¾" in length without grinding, at 375 RPM and 1½" feed in machine.

Please find out what is in this drill, so as to have drills come to us as near like it as possible. It is the drill for our work."

Trade *Mark*

That's the kind of service "Detroit" Twist Drills are giving in high-efficiency shops all over the country, and they'll do as much for you.

"Detroit" Drills must give satisfaction. Every factor that makes for satisfaction goes into them: —28 years' experience, technical knowledge, the best of steel and the best of workmanship and the most scientific equipment a scientific age affords.

Our trade-mark assures you of quality and satisfaction, for we are certain that "Detroit" Drills and other small tools are as good as tools can be made before we put the mark which has become the standard for high-efficiency upon them.

Study Catalog "R." Select the tools you need for some hard work. We'll ship them to you on our "guaranteed good" basis.

"Modern" Chaser Grinders

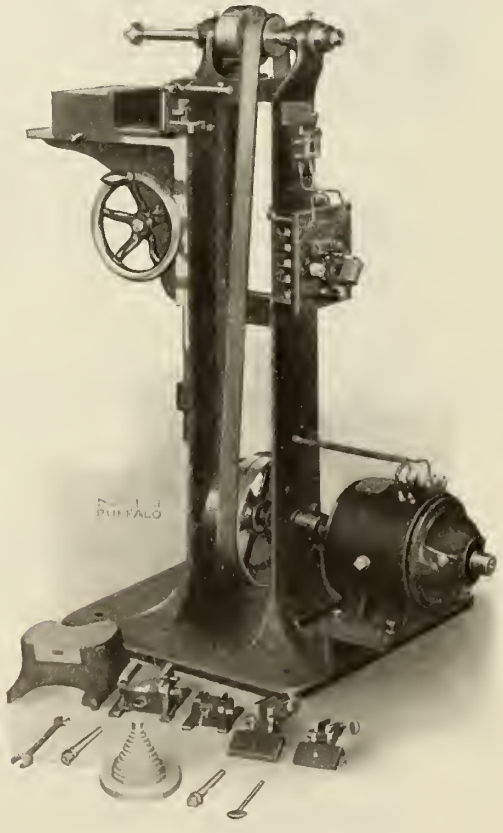
Your attention is called to the remarkable saving that is possible with the machines illustrated herewith.

"MODERN" CHASER GRINDER
(BELT DRIVEN)

Machine Showing Full Equipment

Wherever this Machine has been installed, it has resulted in an enormous saving of time over previous methods of grinding chasers.

If you are interested in reducing the cost of Chaser grinding, it will pay you to investigate the merits of the "Modern" Chaser Grinder.



The "Modern" Chaser Grinder is adapted for grinding chasers for any style or make of die and is equally efficient in grinding bolt die chasers. We also furnish a number of special fixtures with this machine, by the use of which Spring Dies, Pipe Dies, Spiral and End Mills, Milling Cutters, Hobs, Reamers and Taps may be successfully ground.

This machine is simple in construction, inexpensive to maintain, easy to operate and it will save much valuable time in the grinding of your small tools.

The "Modern" Chaser Grinder must command your interest if you are using threading dies. We say this is the "most useful machine ever built" advisedly, and believe that you will agree with us in this statement after you have considered the distinctive features and advantages of the "Modern" Chaser Grinder.

Its economy will be quickly appreciated when consideration is given to the amount of time wasted in grinding your Chasers by hand. It is easier, quicker and better to grind your cutting dies and chasers with a "Modern," as ninety per cent. of the die troubles encountered are caused by incorrectly ground chasers; then, your wasted time is saved and production is increased, and at the same time your threaded work is accurate and uniform.

$58 OPENS THE WAY FOR FULL AUTOMATIC MACHINERY

Our Open Back Power Bench Press No. 201 has been reduced to the very elementals of flexibility in equipment. Either Single or Double-Action Presses can be supplied.

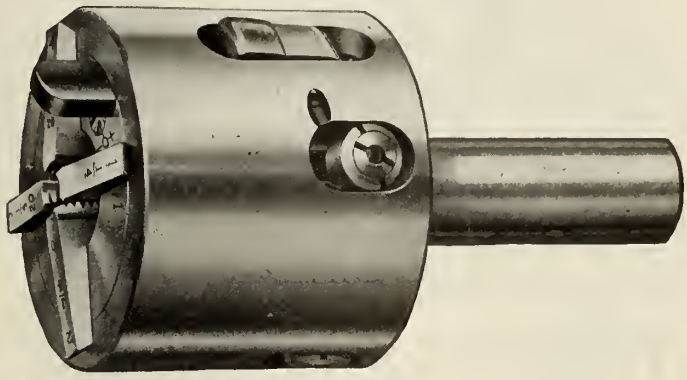
The Plain Press can be purchased—as illustrated, to be fastened to a bench. Or a complete Press with Iron Table and Legs can be ordered. The Table can be ordered with the Press or it can be ordered at any time in the future. Both Press and Table are standardized.

A Back Roll Feed can be ordered with the Press or it can be ordered whenever requirements make it necessary. This Feed takes the metal from a reel and automatically draws it under the tool ready to be operated upon. It feeds in either direction, front to back or back to front, and by adjustment moves the metal forward any predetermined distance at each operation. There is no chance of accident when this attachment is applied as it takes away the necessity of hand operation and makes the Press a Full Automatic Labor Saving Machine.

A Side Roll Feed can be ordered with the Press or at any future time. This takes the metal from a reel in a similar manner to Back Roll Feed, but being attached to side of Press feeds the metal across the bed from right to left or left to right as may be desired. It allows of greater operating space for tools as the metal travels across the greatest width of bed and punch block. Rolls can be adjusted in relation to bed of press.

A Transfer and Automatic Stop Attachment can be ordered with Press or at some later date. This is used in connection with Back Roll Feed. After Press has reached the limit of operation under regular equipment the Transfer carriers or transfers the blank into position for one more operation. It allows one additional operation without rehandling to what would be possible without such attachment.

A Dial Attachment may be ordered with the Press or at any future time. A Dial Attachment will handle small partly finished objects with speed where it would be both dangerous and slow to feed directly to the tool by hand. Lift Pin for Dial and other variations of attachments making them suitable for particular purposes can be fitted.



Bulletin No. 201 gives Full Details and can be had for the asking.

Wells Self-Opening Die

A New Source of Revenue

MODEL T.

The Most Intelligent and Economical Little Steel Workman that Ever Entered a Shop

An Extravagant Practice

It has been customary for so many years to reverse the machine after the thread has been cut, to back the die off the work, that little attention is paid to the extravagance of that ordinary operation. It is an extravagant waste of time, causes needless wear and tear on machine and transmission, and uses more power than is necessary.

Plug That Loop-Hole

by using the Wells Self-Opening Die. When the thread is cut the die opens automatically; the carriage is drawn back; the die closed and started on another cut, all in a fraction of the time required to reverse and back off an ordinary die. And the machine keeps on running smoothly full speed ahead.

So strongly constructed and scientifically designed that it will not cut tapering threads.

Often Saves Its Price in a Week's Run

Sole Manufacturers

Can You Caliper Over a Flange?

Ordinary outside calipers cannot be withdrawn over a flange on a hollow cylindrical piece or similar work, without losing the measurement. Nor can inside calipers measure an interior dimension through a smaller opening. But this work can be done, and done accurately, with the

Starrett
Lock-Joint Transfer Calipers

These calipers were invented and patented by Mr. L. S. Starrett. The pictures above show the use of these calipers (outside style). In the circle at the left, the calipers are being set at the thickness of the casting, below the flange. In the circle at the right, the leg of the calipers is swung out to permit removing the tool over the flange. But note that the short leg is still in the position determined by the thickness of the casting. In the lower circle the leg is swung back to the short leg and the opening between the points may be read from the rule as with an ordinary caliper.

Every shop should have a set of these calipers in both inside and outside styles. Write for free catalog No. 203, describing the full line of Starrett Tools and Hack Saws.

Starrett Tools are sold at all good hardware stores.

ESTABLISHED 1840

FIRTH'S TOOL STEELS

We take pleasure in announcing to the trade that we have opened a warehouse at

79 Adelaide Street West, TORONTO

where we intend to carry the largest stock of HIGH-GRADE TOOL STEEL in the Dominion.

The wide range of sizes, **Annealed** and **Un-annealed,** now on hand in our Montreal warehouse, will be duplicated in Toronto, and we hope to retain old friends and win new ones by making prompt delivery of all orders entrusted to our care.

Thos. Firth & Sons have always maintained, as a consistent policy, the highest standard of **Quality** in their products, which have a world-wide reputation for **Reliability** and **Uniformity,** and the enormous demand for FIRTH'S TOOL STEELS indicates the degree of popularity they enjoy in the industrial centres of both hemispheres.

The following brands will be stocked in Toronto:

SPEEDICUT HIGH-SPEED STEEL—

For all kinds of Cutting Tools. The most durable High-Speed Steel manufactured. Unequalled for **heavy** work on the **hardest metals.**

SPEEDICUT High-Speed Steel **TOOLHOLDER BITS**—

Cut to standard lengths, with angle ends, each piece carefully hardened, ready to be ground and put to work. Sizes on hand—¼", 5-16", ⅜", 7-16", ½", ⅝" and ¾" Square.

FIRTH'S **EXTRA** TOOL STEEL
FIRTH'S **BEST** TOOL STEEL

Standard brands of CARBON Tool Steel—
All leading sizes. Annealed and Un-annealed.

Firth's Best Sheet Steel—No. 2 to 30 gauge. For Knives, Saws, etc. **Firth's Mining Drill Steel,** etc., etc.

We shall be glad to receive enquiries for **Forgings** of every kind, **Nickel, Nickel-Chrome** and other **Alloy Steels, Shoes** and **Dies,** crucible **Sheets** and **Strips,** etc., etc., for direct shipment from the mill.

LIGHTNING LIGHTNING

AN INTERESTING BIT OF HISTORY

To fight for a mechanical principle against indifference and hostility requires sound conviction backed by moral courage. If any one doubts let him try it. But such a fight has its final compensations, for, if the principle be sound, the indifference finally turns to praise.

Forty-two years ago the Wiley & Russell Mfg. Co. was founded. It was the pioneer in the tap and die industry which has since made Greenfield, Massachusetts, famous as the "tap and die town."

The organizers were actuated by a very simple idea, viz.: — to make a tap, every single tooth of which should be relieved to avoid friction and heat,—as lathe-tools, milling cutters and reamers have always been made. This was looked upon as a fine spun theory by many—a hair-splitting operation — and it would have been easier to have followed in the wake of common custom and made taps as others made taps. But these pioneers were made of sturdier stuff. With the courage of their convictions they made taps the new way regardless of comments. Little by little the sure and steady growth of the business and the excellent results obtained by thousands of satisfied users confirmed the original idea as economical, correct and practical, and to-day the trade-mark

LIGHTNING

is known and recognized the world over as the identifying mark of machine relieved taps.

At first the relief was fashioned in the Wiley and Russell plant by hand,—skilled workmen, using a 3-cornered file, cut away the walls of the thread, beginning at a point about one-third the width of the land back from the cutting edge.

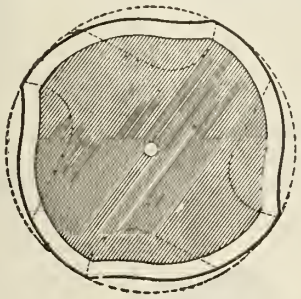

Fig. I.

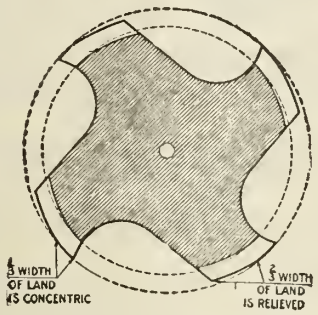

Fig. II.

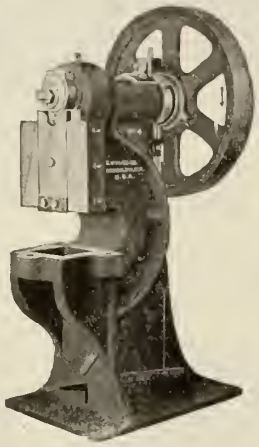
In 1885 this crude method gave way to automatic machines which threaded the steel eccentrically as indicated in the sketch at Fig. 1. (Note the dotted lines indicating where flutes are to be cut later.)



After this eccentric threading the flutes were cut, resulting in the design shown in Fig. II. By leaving one-third the width of each land concentric, ample stock was left to "steady" the tap action and also permit grinding in the flutes for re-sharpening. Two-thirds the friction surface found on ordinary taps was eliminated by this relief.

Of course, imitation was, to be expected. It came. Wiley and Russell consider these imitations the sincerest commendation yet offered the **Lightning** tap. The newcomers are to be congratulated upon adopting the sound mechanical principle which the Wiley and Russell organization advocated, alone, for over 40 years.

It should be borne in mind, however, that the spirit of progress which has always animated the Wiley and Russell organization has brought forth many **other** improvements which cannot be duplicated elsewhere, such as their special steel, their hardening process, their testing devices for strength and many similar features which are exclusive with the original "**Lightning**" tap. By specifying "**Lightning**" when ordering of dealers, users will be assured of receiving the genuine.

Wiley & Russell Manufacturing Co.
Division
Greenfield Tap & Die Corporation
Greenfield, Massachusetts, U. S. A.

IF A BETTER TAP IS EVER MADE **W. & R.** WILL MAKE IT.

"Stiles" Power Punching Presses

embody strength and rigidity with convenient handling of material. Entire pressure is through solid metal.

Graduated eccentric adjustment facilitates setting dies. Slides are long and well gibbed; watchmakers whose dies are most delicate use "Stiles" Presses extensively. The fly-wheel can be turned backward to release a punch when stuck in the die.

Built in ten sizes, they are adapted for punching, stamping, forming and bending operations in the economical manufacture of cutlery, hardware, locks, auto parts, typewriters, sewing machines, etc. Catalog No. 2 G on request.

A Good Air Hoist

INGERSOLL-RAND AIR HOISTS

are of the straight-lift type—the cheapest method of making the numerous, short, quick lifts about a shop.

Power is applied to the load in the most direct manner and compressed air is so elastic as to adjust itself to the load without loss of power.

The control is particularly sensitive, making adjustments to a fraction of an inch a simple matter. This feature is of importance in placing work on a machine tool.

The operating valves are of the automatically tight closing type, eliminating the waste of air. A safety check valve prevents accidents and adds to convenience.

Embodied in these hoists are efficiency, accuracy, economy and safety, the dispensing of any one of which would make the hoist more of a nuisance than a time and labor-saver.

Every ball takes its share of the load in

Hoffmann

Journal and Thrust Bearings

The Reason

Every Hoffmann Ball is guaranteed not to vary from absolute spherity or standard size by one ten-thousandth of an inch (about one-tenth the thickness of tissue paper.)

The Result

Because the load in Hoffmann Bearings is thus equally distributed, friction is reduced to a minimum, and the life of both Balls and Races is greatly prolonged.

We have over 40 sizes of Hoffmann Balls in stock, from 1-16 to 4 inches, and over 50 sizes of Journal and Thrust Bearings.

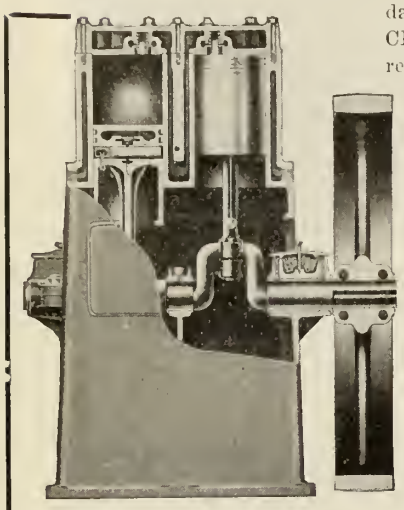
Vital Factors in Profitable Casting Cleaning



A Good Sand Blast and Cheap Air

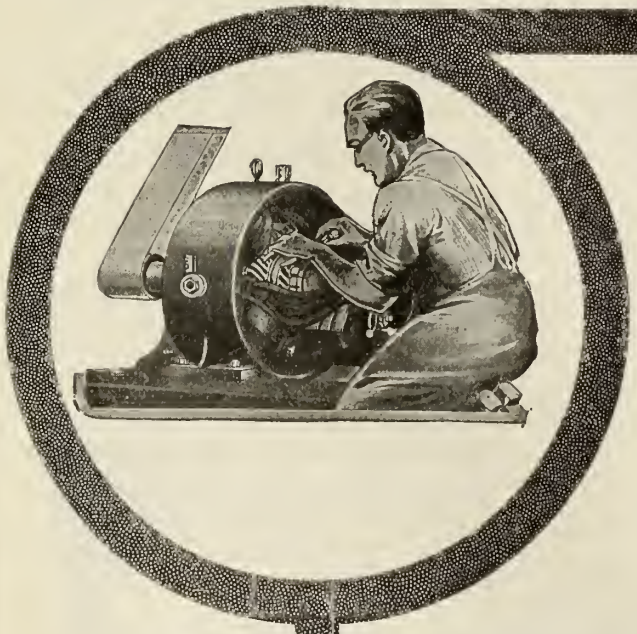
Curtis Sand Blasts

Closed Hopper Sand Blast

Have many features that make them superior.
For instance—Sand screened and Hopper filled at one operation.
LEVER-OPERATED FILLING VALVE is much faster and handier than the usual screwed-in plug or bolted-on cover valves.
HANDY THROTTLE CONTROL that saves time, air and sand.
WATER SEPARATOR that means fewer chokes due to damp sand.
CHOKE RELIEF VALVE that almost instantaneously relieves a choke when one does occur.

GREATER CUTTING ACTION, due design that insures less drop in pressure between air line and nozzle.—But why not send for a Curtis Blast on thirty days' free trial?

CHEAP AIR.



Service tests prove that CURTIS COMPRESSORS will furnish air at minimum cost for operating and maintenance. They have FEWER PARTS than most compressors and less friction loss. Cylinder heads and valves, as well as cylinder walls, are water jacketed (about 80% more cooling area than double-acting compressors), insuring minimum discharge temperature and less loss of power in pipe line. THE VALVES are lightest of all types—tempered steel discs (1-16 inch in thickness) they operate earlier and require less attention than any other type.

Write us for Bulletin C-1 and Prices.

A very severe service because of

GRIT, DUST AND HIGH SPEED

GULLETT GIN COMPANY
Manufacturers

COMPLETE COTTON GINNING OUTFITS.

P.O. Amite, La., Feb. 4th, 1888.

Gentlemen:—We are using your MAGNOLIA METAL in our Magnolia Gins, Feeders and Condensers to our entire satisfaction.

We have adopted Magnolia Metal as the standard anti-friction compound for our machinery, believing it superior to any we have heretofore used.

Yours truly,
GULLETT GIN CO.
Geo. A. Peete, Mgr.

GULLETT GIN COMPANY
Manufacturers

COMPLETE COTTON GINNING OUTFITS.

Gentlemen: P.O. Amite, La., Feb. 26th, 1914.

It gives me pleasure to state that Magnolia Metal is used by us in all high-speed bearings throughout our line of cotton ginning machinery and has given our customers as well as ourselves excellent results. We wish to state further that we have not had a single complaint where Magnolia Metal has been used.

We are also pleased to say that we use nothing but MAGNOLIA METAL to repair bearings of our high-speed wood-working machinery in our wood-working plant, which consists of about forty-five wood-working machines ranging in size from a 12x30" S.A. Woods Timber Sizer down to a 12" hand jointer, embracing quite a number of different types and makes, bearings in some of which have been running almost continuously 3500 R.P.M., ten hours per day, for five years, and show little or no perceptible wear.

Very truly yours,
GULLETT GIN CO.
T. E. Johnson, Supt.

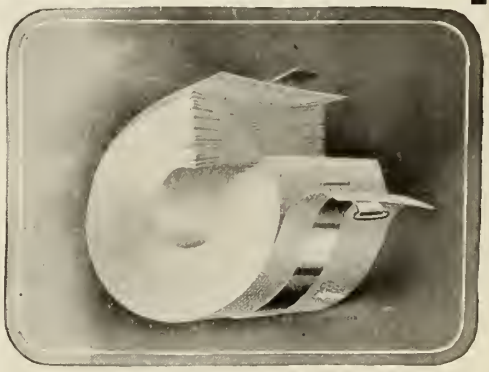
You Are Deceiving Yourself If You're Using Ordinary Pipe Covering

The mere fact that your steam pipes are covered doesn't necessarily mean that you have eliminated waste of steam by condensation. If you're using ordinary pipe covering you are still losing considerable steam—hundreds, perhaps thousands, of dollars' worth annually.



Therefore ordinary pipe coverings are a constant expense, as their very construction and composition render maximum efficiency impossible. At their best they allow from one-quarter to one-half of the fuel consumed to go to waste by radiation and condensation. And in a comparatively short time they become absolutely worthless.

J-M ASBESTO-SPONGE FELTED PIPE COVERING

positively prevents this waste of steam. Its presence is a guarantee that every pound of fuel consumed is delivering the maximum quantity of steam.

J-M Asbesto-Sponge Felted Pipe Covering is the most efficient covering on the market because it confines the greatest number of dead air cells. It's made of pure Asbestos Fibres and finely ground sponge. It is practically indestructible and retains its insulating efficiency indefinitely. It has been found in perfect condition after more than 15 years' service on underground pipes.

Take the first step toward steam-plant efficiency by writing nearest Branch to-day for a copy of our Catalog No. 100.

"Change to Chains"—Morse Silent Chains

It pays to "change to chains," substituting MORSE Silent Chains for power-losing belt drives and noisy gears.

It pays in the greater efficiency of the chain (power saving); in the smooth, quiet action at high or low speeds; in protection to electric motors from shocks and jars on the machines; in less floor space required and less maintenance and attendance.

It will pay right from the start to "change to chains," but, remember it is better to make MORSE Chains the original drive wherever possible. Write us for complete information, also asking for free copy of Publication No. 12.

More coming each month.

Gear Data for Your Note-Book

PATTERN GEARS

(Hamilton Gear & Machine Co., Toronto)

Metal patterns with accurately machine-cut teeth solve some of the difficulties in the use of moulded gears. For repetition work they are a necessity.

It is essential to know the exact shrinkage of the iron to be used.

Very little draft is required on machine-cut patterns. For narrow-faced gears of moderate size no draft is needed on the pattern. By using a stripper plate with machined teeth quite wide-faced gears may be moulded without draft.

For bevel gear patterns we recommend the twenty degree involute tooth form. This gives a much cleaner draw from the sand, there being no approach to undercutting at the root of the tooth. For the same reason it is a stronger tooth. We are equipped to cut this form as well as the usual fourteen and a half degree involute in bevel gears up to about sixty-two inches outside diameter.

"Service First" as applied to Fairbanks-Morse Induction Motors

The rotating part of an induction motor is bnilt like a sqnirrel cage, the ends of the horizontal bars being joined together by copper rings.

The first and simplest form of connecting the bars with the rings was by means of steel bolts, screws or rivets, and sad experience proved the faults of this constrnction.

Heavy starting currents naturally developed considerable heat. The resulting unequal expansion of the different metals forming the joint, caused it to open and prodnce severe arcing with ultimate destrnction of the joint. The gradual development of this condition decreased the efficiency of the motor and finally resulted in a general breakdown requiring extensive repairs.

The soldered end-ring constrnction which followed met the same fate. The inherent ability of a good electric motor to develop power greatly in excess of its rating with its conseqnent heating, brought out the limitations of this method. The solder would throw out.

It was in searching for something better that the "Cast-on" end-ring construction as applied in its most approved form to Fairbanks-Morse Indnction Motors, was conceived.

This consists in actually fusing the ends of the copper rotor bars into an end-ring of a special composition, thereby producing a perfect electrical and mechanical joint. In this process the rotor, with its bars in place, is put into a mold (see illustration) and the red-hot molten metal poured aronnd the bar, melting their ends and effectually fusing them into the body of the ring. The ring is then turned down to finished size and polished.

As this metal is fused to the bars at a temperature in excess of 1,000 degrees centrigrade, it is readily seen that the destructive effect of any subsequent heating is entirely eliminated.

Having no bolts, nuts or washers to break or become loose, no solder to melt and throw out, and yet having the metals in most intimate contact, makes this the one perfect and indestructible joint that designers have sought for so long.

Other details described in Bulletin 202H. The thousands of Fairbanks-Morse Motors in use to-day is a sufficient guarantee of their excellence.

How May Employer and Employee Earnings Be Increased?*

By J. C. Spence **

The author, on the assumption that competitive conditons will in the future be very much as at present existing, expresses the opinion that the only method whereby the personnel of the machine tool industry on this continent can be kept in the highest class is by the offering of greater wage inducements. The mere act of holding a job has ceased to be the all-important factor.

THE record of the recent past, and the known evidences as to the immediate future point out the fact that if the machine tool industry of this continent is to compete for the best class of workmen, there must be a change in our methods. Competition with Europe and with each other precludes the possibility of any great increase in the selling prices of our products.

The changes, then, must happen within our organizations: we must get more saleable goods per dollar of investment, and this result must be attained, not by a decrease in the earnings of all concerned, but by an increase, else we will gradually lose the best of our men to such other industries as have, at present, a larger margin of profit. This movement has already made inroads into the field of good machinists, and every one of you is familiar with the statement that "we can't get the kind of man that we could some years ago." This lack of good men is, of course, not due entirely in our line, to the fact that other industries are offering better opportunities, but is more or less influenced by the fact that the growth of industry in general is faster than the supply of trained men would warrant. Nevertheless, it is a known fact that one industry in particular is taking from us many of our brightest young men, and is taking them almost entirely because of wages.

Employers Blameworthy.

Whenever the word efficient or inefficient has been used as applying to our line of work, the natural tendency has been for all minds to turn to the shop end of the business, especially to the man who runs a machine. Practically all of the illustrations by means of which our eminent experts have arrested the attention and gained a permanent lease of the ears of managers and boards of directors, have had to do with such perfectly awful incidents as a shaper tool taking a 5-in. stroke when a 3⅝-in. stroke would have been sufficient. I hold no brief for the man who cuts air when he should cut metal, but to my mind it is no more than right that we should first look to ourselves to see wherein we fall short of the mark of 100 per cent. If the workman be not efficient just what is our share of the cause of his inefficiency?

First, let me say, that it is my firm belief that the large majority (if I were to state a percentage I would say 70 per cent.) of all machinists employed by members of the National Machine Tool Builders' Association, are endeavoring to give you an honest day's work. That they do not give you more work than at present is largely your fault—so much your fault that it is going to take the whole of your attention to certain details before you can induce your men, and hence yourselves, to earn more money.

I am saying this from a mind that only a comparatively few years ago looked at the workman's side, only, of this question. I am not so far away from the operation of a machine that my memory has become dulled to what went on when I was trying to produce in face of obstructions which were allowed to stand in my way by my foreman and by his superiors. The metal cutters or chip makers on the simpler class of work may be assumed to be fairly efficient in most of our shops, and it has been a comparatively easy matter to set standard times or prices on these operations.

GETTING THE MAN INTERESTED.

You've got to get the man interested, and there's only one way—put him into "business for himself." How this is to be done, whether by premium or piecework, matters little, provided you see to it that more product means more wages There is just this much about it—those of you who stick to a straight day work system, unless you devise ways of periodically rewarding increased efficiency, will lose your men to the shops that succeed in putting every man in "business for himself."

Shop Drawings Lacking in Instruction.

There is still a good field for improvement in the making of drawings, especially for the workman's use. I'll venture to say that in every one of our shops to-day there are blueprints that the "old man" himself would not recognize as showing a part of his own inventions, if some one should cut the title corner off, and as for settling where the machining should begin, he would have to lose a good many minutes in study. Even the simpler drawings are a puzzle to the beginner and the foreman cannot be in all places at once. We should point out, on our drawings, by copious use of English and by means of routing sheets, just what the workman is expected to do.

I have not had the pleasure of visiting all of your shops, but the most of those that I have seen are open to this criticism. We are all drifting along, to some extent at least, in the old way of leaving a workman to his own initiative to find ways and means of doing a great share of the operations. The draftsman who learns to make drawings with the idea of saving time in the shop, gradually makes of himself an engineer in the true sense of the word, because in order to tell how a piece should be made, he first has to learn by consultation with those who do know. He is inducing himself to earn more money.

The foreman, who is fortunate enough to have his blueprints come to him in such form that the more intelligent of his men need little personal instruction and supervision, has more time to devote to the weaker members of his gang and his department output is higher—consequently, his own value increases.

Operator's Relation To His Work.

Right in line with this plan I recently tried an experiment that is interesting because it is illustrative of exactly what is going on in many shops and is causing the loss of a lot of money. A quantity of a certain small piece was sent to us by another firm to be ground. We had quoted on the work and there was a price we had to meet. As usual, in such cases, before letting the work start in the shop, we sent along with the pieces a routing sheet, which told how many pieces per hour we had estimated to be a fair production. The pieces were produced inside of the time limit and the net cost per piece was 1½ cents.

Several months later a lot of the same pieces came in and these were put into the shop and ground by the same man, but without anything to tell him what was expected of him. The second lot cost two cents each. Now the operator was not dishonest. I do not believe that he inten-

*From a paper read before the recent National Machine Tool Builders' Association Convention.

**Superintendent the Norton Grinding Co., Worcester, Mass.

tionally held back. He simply wasn't in business for himself. He would have produced these pieces for 1½ cents if there had been any means supplied for concentrating his mind on the job. Even if he had run into an obstacle that he couldn't overcome, he would have called for help, quickly, in order to protect his own record. As it was the time drifted by without his having a very clear idea of anything in particular.

You've got to get the man interested, and there's only one way—put him into business for himself. How this is to be done, whether by premium or by piecework, matters little, provided you see to it that more product means more wages. There is just this much about it—those of you who stick to a straight-day-work system, unless you devise ways of periodically rewarding increased efficiency, will lose your men to the shops that succeed in putting every man into business for himself.

Example of Cost Reduction.

I know of a shop that has reduced the cost of erecting its machines as shown by the following table, by doing two things: first, giving up the old, slipshod method of starting to erect before everything was ready, and second, by putting the assemblers into business by giving them a generous bonus for speed.

	Old Cost Average	New Cost Average
No. 1	$43.73	$22.62
No. 2	45.01	19.78
No. 3	45.21	18.26
No. 4	36.78	18.25
No. 5	41.26	18.84
No. 6	32.35	18.97

The bulk of this reduction was due to the fact that all of the parts were ready before the erecting was started, but a lot of the saving came from putting the men into business. Where they were formerly paid $3 per day, at day rates, they now earn about $4.50 per day, and the rest of you would have a difficult task in trying to hire one of these men to go back to the old $3 job, even if you guaranteed less exertion per 10 hours.

Incidents Arising From Up-to-date Practice.

An incident reported to me by the foreman of that job shows how it works out. He overheard one of the assemblers using rather forceful language to a truckman. It seems that the truckman had been sent to the stores to get a certain mechanism that was to be the next one to go on the machine. He arrived at the stores at about six o'clock, and, as the mechanism was covered with an anti-rust compound, the stores boy, not wishing to again wash his hands, put him off with some excuse. The truckman went back with an empty truck and the conversation overheard by the foreman was the result.

I cannot, for obvious reasons, quote verbatim what he told the truckman, but the gist of it was to get back to the stores with word that the mechanism had to be at the machine ready to be used at 7 o'clock the next day or something unpleasant would happen to both the truckman and the stores boy. That assembler was in business for himself.

Another incident: — A lot of gears were being machined at the turret lathe, and the operator could, ordinarily, make good pay at 10 cents each. The foundry had evidently made the gears of iron that was intended for larger work. They were hard. Under the old methods, it would be only by accident that this fact would be discovered before the job was completed. In this particular case the workman appealed to his forman who took the matter up with the superintendent. The result was that the foundry acknowledged its error, paid for the amount the operator ran behind and the expense was put where it belonged. That man was in business for himself.

POINTING OUT MANAGEMENT INEFFICIENCY.

A management that will accept, without considering it a personal affront, the statement that it is not as efficient as it could easily be made, and at the same time be so constituted mentally that it is eager to share with the producer in any saving that may be made, will easily find ways to reduce cost, and need have no fear either of being unable to get good men or to hold them loyal.

An operator noticed that some bars in a lot of tool steel machined much more rapidly than others. His insistence on having all the bars good ones led to a thorough investigation of the whole question, and the formulation of specifications on tool steel, that now enable that firm to form 3-in. diameter tool steel bars with tools 3 in. wide at a surface speed of over 100 ft. per minute.

Rate-Setting Department Essential.

The firm, from whose experience these incidents have been cited, believes that the best way to put a man into business so that he can share profits on each job he does is to have a rate-setting department made up of good operators, under the leadership of a man who is, himself, capable of taking hold of any productive job in the works. It is almost always found to be a fact that a careful study of a job, not by the stop watch, but by actually doing it, leads to improvement. Sometimes there is only a slight gain. In other cases the time has been reduced to one-third of its former time.

The rates are set on the principle that since it has been found possible to reduce the cost and the concern was satisfied with that cost before this discovery, then the new rate can be placed well above what it actually can be done for. This is contrary to the old spirit of management, but is right in line with what most machine tool men at least believe, and is the only way you can get your men into business for themselves.

In this connection I do not wish to be understood when I mention the stop watch, as not agreeing that oftentimes facts can be learned and gains made through the medium of so-called efficiency workers, who are themselves perhaps incapable of performing the operations, but who are intelligent observers. What I do mean is that, personally, I believe the greater savings are to be made by having a skilled man study the job from an inventor's standpoint rather than from that of a recorder or historian. All interferences with production are not evident to a mere observer. Most of them hark back to the design or to conditions imposed by the relations of a given piece to others in the same machine.

Commonsense Scheme a Sure Winner.

The efficiency movement, like many other great movements, has its quacks who seize the time of unrest to play upon the credulous ignorant, but every one of us should be thankful for the impetus given to our minds by the crusade definitely started by F. W. Taylor. The obtaining of the benefits of this common sense scheme need not cost anything. In fact it can be made to pay almost from the beginning. One good man can do enough for a group of men in so short a time that the extra production of the group will pay not only for the money spent on them, but also for further work with other groups. The scheme, properly conducted on a common sense basis, without frills, is soon compounding its gains. Such a movement, to be successful, requires the hearty backing of the management, for there will always be men in every organization, perfectly honest in their views, but who are unable to see beyond the tips of their own noses, when it comes to making a change from the established order of things.

A management that will accept, without considering it a personal affront, the statement that it is not as efficient as it could easily be made, and at the same time be so constituted mentally that it is eager to share with the pro-

ducer in any saving that may be made, will easily find ways to reduce cost and need have no fear of either being unable to get good men or to hold them loyal.

Educating the Operative as to Values.

Men are more often careless through ignorance than by nature or intent. The man who spoils a piece of work knows that he has destroyed value, but to him the time lost is usually the item that appears to be the most important. Men should be educated in the total value of the goods they handle. They should know the cost of materials and approximately the shop burden.

I know one superintendent who has adopted the system of having all spoiled work reported to him on a card that states the fault and the number of pieces spoiled. Whenever the case is of enough importance to attract his attention he makes it the excuse for a friendly talk with the man who did the job. He talks the affair over in a way that brings out both sides of the case. Before he lets go of that incident he has taught that man a whole lot about what it costs to carry the burden of a business. He has done more good than any "call down" would do, and he has strengthened the workman's loyalty to the firm, and this, without saying, includes a determination to spoil no more if he can help it.

Discharge should be the last resort, and a frequent use, under ordinary conditions, of the power of discharge, for any reason other than the lack of work is the sign of a poor shop management. Under the management that finds its main corrective in discharge, the new man will be at a still further disadvantage because he will not have had the experience that caused the downfall of his predecessor.

Making the Foreman an Executive.

Now and then you will find a foreman who is a natural born business man, but this kind is rare, as foremen are usually promoted to their positions because they are good workmen, and not because of the other qualities that a foreman should have. There is a lot of difference between a good workman and being a good executive. Most foremen have no definite idea of the cost of anything, except net labor, and it is not their fault either. Management rarely interests itself in a foreman to the extent of trying to make a real business man out of him. Yet the returns are well worth the effort.

Just start a scheme whereby each foreman really runs his own department and knows exactly where every cent is spent for which he is responsible, and you will find a most interested and watchful lot of men. You will find that having the entire list of officers on the alert for economy is away ahead of trying to do all of the worrying yourself about the time the cost department reports the facts, which is several weeks after the damage is done.

At the Norton Grinding Company we keep an account against each foreman and gang boss of all of the expenses for which he is directly responsible, that is, repairs and replacements, supplies, non-productive labor, spoiled work, etc. Such items as taxes, rent, power, etc., are, of course, not considered, as he has no direct control over them. The total of his expenses divided by the total of his productive labor gives what we, for the sake of comparison, call the overhead of his department. At the end of the month he is given by the cost department all of his supply requisitions with the costs marked in, and all through the month, if another foreman does for him any non-productive job, such as repairing a machine or grinding a cutter, a duplicate of the time card is sent to him with the total money cost showing. This system has aroused more interest among the foremen than any scheme we have yet found.

MANAGEMENT INTEREST IN FOREMEN.

Management rarely interests itself in foremen to the extent of trying to make them real business men, yet the returns are well worth the effort. Just start a scheme whereby each foreman really runs his own department and knows exactly where every cent is spent for which he is responsible, and you will find a most interested and watchful lot of men.

Interest Among Foremen.

One foreman found that he was being charged $10 per week for trucking, the truckman, up to that time, being responsible to the head inspector, and responding to calls much the same as the bell boy plan in a hotel. The foreman kept careful record for a few weeks, and then made the announcement to me that his trucking was worth only $6 per week and that he didn't want to pay $10 for it The result was that we took one truckman away from the inspector and put him at productive work in the casting department, and the foreman hired a cheaper man to do simple productive work some of the time and trucking when it was needed.

Another foreman came to me with a milling cutter and said: "We make cutter grinders for sale. How much time would you tell a customer that it would take to grind this?" I knew something was up, so I was conservative. My estimate was that it ought not to take over two hours. He thereupon produced a charge by another foreman of sixteen hours for the job. We both made a trip to see the other foreman, with the result that the charge was reduced to two hours, which all agreed was ample. The foreman who had done the job was charged with fourteen hours of spoiled work, and the grinder operator was given his notice because his foreman said this was simply the climax of several such incidents, and he had failed to show any interest.

Even second-hand belting suddenly assumed great importance. I did not, at first, foresee that hairs would be split so fine, but it did not take long before a foreman wanted to know what became of a certain belt that was taken out of his department and replaced by a new one. I told him the good part of it would be spliced to another piece and used again. He wanted to know if I didn't think he ought to have credit. So now, when we take an old belt out, if the man in charge of belting says the bulk of it can be used again after cleaning and repairing, we credit the department with one-half the price of a new belt. When we use that belt again we charge the department getting it with one-half the price of a new belt.

Cotton waste is down to ¼ lb. per week per man using waste, and belting is down to $18 per month, average, for the whole shop, where there are 1,160 belts in almost constant use every working day.

The foremen are enthusiastic over the scheme. One foreman said, "Sure, I like it. It teaches me so much about my job that if you don't treat me right, I can go to some one else and tell him for just how much I can run a department, including my own wages." That is just the position we want him to be in, because we, being on the inside, know all about him and ought to be able to keep him, if we consider him worth keeping. If, by poor judgment on our part, he leaves and is really worth more, then we can rejoice with him that he has benefited.

Relative to the Superintendent.

The superintendent should never be too busy to take care of any matter that the foremen or workmen think is important, whether or not it is firm's business or personal, and he should be a man in whose word the men have confidence. His training and his actions should be such that the men will know that he is not asking for anything unreasonable, or that he would not do himself. He must be an enthusiast in his business. He must be a boy with the

boys; in fact, he must never forget to be a boy at heart. All first-class enthusiasts are. He must always be on the lookout for good qualities in men. He must campaign for loyalty, a shop's best asset, just as the nation, through the public schools, campaigns for patriotism, for both are the result of plan and not of accident. Loyalty, like patriotism, is spontaneous only in times of intense emotion. It has to be created and fostered by well-laid plans that have for their fundamental principle, the giving of value for value received.

The superintendent must have the co-operation of the management in teaching the so-called non-producer that the business of capital is to make dividends, and that the only excuse for his particular non-productive existence is to help productive labor to make more chips or to get something assembled faster or better, and that the closing of his day's duties at a certain hour is merely an unimportant incident instead of being the great event that tradition has made it.

THE FACTOR OF SAFETY.

IN a paper read recently before the Staffordshire Iron and Steel Institute, Mr. C. E. Stromeyer, chief engineer of the Manchester Steam Users' Association, said that the expression **Factor of Safety** was adopted by the engineers of the early days of the last century, when structures in iron were novelties, in order to inspire confidence in those who were going to use them. It may also have been hoped that a competition amongst engineers for high **factors of safety** would conduce to safety; at any rate, Sir William Fairbairn at one time seems to have advocated a **factor of safety** of seven. The public, however, refused to be made judges in technical matters, and preferred to rely on the expert knowledge of engineers, amongst whom the expression **Factor of Safety** then merely meant **Measure of our Ignorance.**

In those early days our ignorance was truly great, for materials could not be tested, and the mathematical treatment of many engineering subjects was still in its infancy, but now, although much progress has been made in both directions, many engineers still cling to the expression **factor of safety,** though, on the Continent, the somewhat more expressive term **permissible working pressure** is now commonly used. The one term glosses over the fact that we do not, for instance, know definitely what is the ratio between safe working stress and ultimate tenacity, and the other term merely states that engineers refuse to be guided by laboratory tests, and have by experience fixed on certain stresses as being safe.

Both expressions hide the fact that the mathematical formulae used by engineers are of the crudest, and do not correctly determine the actual stresses produced by external forces, they also hide the fact that these external forces are sometimes very imperfectly known, and they hide the fact that even when using the most carefully-tested materials, and handling them with the greatest care in the workshops, there is always a chance of a flaw or a brittle locality, which may cause failure.

Case of a Rivet in Shear.

Consider the case of a rivet, said Mr. Stromeyer, which is subjected to a steadily-increasing shearing stress. The intensity of this stress will be distributed over its section in the form of a paraboloid of rotation, and the maximum stress at the centre of the section is then seen to be double the mean stress.

Suppose the limit of elasticity for shear to be 8 tons per square inch, then this limit will be reached when the mean stress exceeds 4 tons per square inch. This maximum stress of 8 tons should not be exceeded under safe working conditions, but engineers only refer to the average stress, and compare this with the ultimate shearing stress in the rivet of, say, 20 tons, which, before rupture, is, of course, uniformly distributed over the section, and they fondly imagine that, as the ratio between the average elastic stress of 4 tons, and the ultimate plastic stress of 20 tons is as 1 to 5, they are working with a **factor of safety** of 5, whereas, in reality, this factor is made up of 50 per cent. of mathematical convenience, and 50 per cent. of ignorance as to the true value of the elastic limit, which, judging by recent fatigue experiments, is much lower than was at one time imagined.

Straining a Beam to Its Elastic Limit.

When straining a beam up to its elastic limit, of, say, 10 tons per square inch, the maximum elastic stress is expressed by the formula $S = 6\ M1 : b\ h^2$, whereas, when this limit is passed and the ultimate stress of, say, 30 tons is approached, this stress is expressed by the formula $S = 4\ M2 : b\ h^2$, and the ratio of the ultimate to the elastic moment is $M2 : M1 = 30 \times 6 : 10 \times 4 = 4.5$, which, by most engineers, is looked upon as being the **factor of safety,** whereas the real factor is $30 : 10 = 3$. Thus, in the one case the ratio between ultimate strength and limit of elasticity is doubled in order to arrive at the **factor of safety,** and in the other case it is only increased 50 per cent.

These two examples, and many more could be adduced to justify the continental practice of using the term **permissible stresses** when associated with particular engineering formulae.

External Force Feature.

Similar remarks apply to what might be called external forces, about which the mathematics as used by engineers are often far from comprehensive. Most engineering text-books demonstrate that a load which is applied suddenly results in a stress which is twice as great as that which a gradually-increasing load will produce, and engineers seem to rely on this one demonstration for their practice of assuming that stresses due to live loads are twice as great as those due to steady loads.

This is merely a mathematical convenience for average conditions, for it ignores the fact that the expression is only true if the load be a weight. The suddenness of the steam admission into a cylinder, and the suddenness of a gas explosion, do not double the stresses in the cylinders, pistons and rods beyond what they would be under a steady pressure of the same intensity, and, on the other hand, the sudden application of pressure which occurs when two elastic bodies collide leads to much severer stresses than double the static one.

If each case were dealt with on its merits the estimated stresses would often be much intenser than the customary rules make them out to be, and the **factor of safety** would be found to be much lower than was believed. Then, however, the very legitimate conclusion could be drawn that if certain structures are safe with these comparatively low factors, other structures for which improved mathematics show large factors might be reduced in dimensions.

The term **factor of safety** also covers our ignorance of the real properties of materials and their behaviors when stressed. Much has been done in the past by the introduction of quality tests and the use of testing machines, but much yet remains to be done before even engineers can take the initial step of defining how many chances there are for and against occasional failures

OFFICE TIME STUDIES.

COST of letters and orders is receiving attention by firms who realize that ascertaining the cost of writing an order is as important as knowing the price of a manufactured part.

One concern who recently took up this question ascertained that, in January, 27 minutes were consumed in handling every order, and in February 29 minutes; net average of 28 minutes, at a cost of 14 cents for clerical hire, independent of all other expenses.

Neither of these facts are difficult to ascertain, and no firm can hope to have orders handled efficiently until they have a basis to work upon.

Value of a Hobby and its Pursuit by Otherwise Busy Men

By George Sherwood Hodgins*

Whether or not a hobby be useful work for the world, its value lies very largely, if not wholly in the fact that it affords an opportunity for a complete change, not only in the character of the work done, but in the bodily surroundings and change of scene, or change of air.

DID you ever stop to think that we do a lot of things for which our bodies are not particularly well adapted? We use our eyes on printed pages, which is certainly not what the ancestral eye was evolved for. We live in steam-heated houses and work in steam-heated offices. We very seldom get a real sun bath. We continue at the same kind of work day after day with very little out-door exercise. We eat too fast and too much, and often take the wrong kind of food. We maintain an habitually upright position of the body, which is certainly not the practice of the man-like apes, who are our nearest relatives in the flesh. We do all these things and many more of the same kind, with apparent facility and without much thought, and still we live and work.

How far this mode of life is removed from Nature becomes apparent, only when we, with mistaken kindness, take some more "natural" race, such as the North American Indians and subject them to like treatment. The "civilization" of the savage usually results in his discomfort, disease and death, and in time his race becomes extinct. We live as we do, by virtue of an abnormal heredity which has very probably become ours as the result of a far-reaching experiment as to the best way to fit the race for its self-made economic and industrial system, and its other forms of "artificial" existence. We are still making the experiment and the end of it all is not yet in sight.

In speaking of the Anthropoids, or man-like apes as our nearest relatives, we do not mean to assert the correctness of the popular idea that man is descended from a monkey, but rather that both are derived from a common stock, like separate branches on the same tree. The fundamental unity of man and the man-like apes lies in design, structure, and physical characteristics, and this is evidenced from their both having developed upward, along divergent lines, from the same original stock.

If then, it is conceded that man to-day is engaged in pursuits for which nature did not intend him or specially fit him, and that he is really in the transition period, emerging from the thraldom of fear and the tyranny of the physically strong, and striving for the care-free life to which he has not yet attained, then it follows that he has been forced to adopt many devices and artifices or enlarge those he has had, in order to produce effects, which once were his possessions in the vigorous, free, outdoor life of his remote ancestors. He has even yet, in his sedentary life to maintain some slender connection with nature and the past.

The unnatural use of the eye produces disturbances which have to be corrected by the use of spectacles. Often the hearing has to be supplemented by the use of the aucoustican. Gymnastic exercises and athletic games take the place of the struggles of war and the exertions of the chase, and careful dieting has to be observed, when the body is out of order, so that it may be fitted for the particular kind of work which has to be done by the individual, under our subdivided economic and industrial conditions.

GETTING BACK TO NATURE.

We are the result of evolution, and even fortified by the effects of our somewhat artificial training and our abnormal heredity, we must still, in some form, "get back to nature," and the beneficial effects of the pursuit of a hobby as a means of approximately attaining that end has raised it above the level of a mere pastime to that of a serious and scientific necessity.

The brain is used more extensively now than in the primal stage of man's existence, and as a consequence a more highly developed brain and nervous system is the result. The progress we have made in this direction stands out very distinctly when we contrast ourselves with savages of equal or even superior physical development. The clean, quickly-made incision of a polished Mauser bullet in the non-vital part of the anatomy of a modern soldier is capable of so disturbing his whole nervous system as to place him temporarily hors-de-combat,—he cannot go on. The less "civilized" man is, for the time, unaffected by the bullet wound. The less finely his nervous system is, the less he suffers from shock, and thus the savage may fight his way right into the enemy's lines, and there fiercely strike his blows, even after he has received a mortal wound. It requires the jagged, shattering death-blow of the dum-dum bullet to at once check his valorous and headlong rush.

The modern business man, or factory head, or thinker in whatever walk of life he be is equipped with a brain and nervous system, finely organized and highly complex, responding quickly to shock or stimulus, doing without many of the once vital connections with nature. This brain is made to work with tread-mill regularity, that its owner may accumulate money, or place or power. In thus getting, at least partially, away from "mother earth," and all that this implies and relying on the product of the brain as the one and only necessary output required to sustain existence, man has practically sailed out on an unchartered sea. The brain is his chief "tool," and with it he fashions life, most often without knowing the nature or the possibilities of what he uses. He has brought himself within the influence of psychological environment, the gradual mastery of which he is bound at last to attain.

Influence of a Man's Surroundings.

A good many men think themselves unaffected by their surroundings, and though their homes are comfortably or even artistically furnished, their offices are generally bare and unattractive, and are without many minor conveniences. The consensus of scientific opinion to-day is that man is most decidedly affected by his surroundings. Instances are not wanting in which the presence of a few flowers has added to the pleasure or the contentment of the workers in a factory, and this feeling is not without its commercial value. Munsterberg tells us of the introduction of a cat into a workroom where men were engaged in fatiguing work. The presence of the cat stimulated their social consciousness and became a joy-giving plaything for the men. The presence of the animal did not interfere with the amount of work done, but rather improved it by forming a pleasant diversion for the minds of the toilers. Many experiments made in psycological laboratories have shown what hours of the day and what season of the year are productive of maximum output. The head of a large factory in Germany found that the shortening of the

*Assistant Engineer, Mechanical Department, National Transcontinental Railway, Ottawa, Ont.

working day from nine to eight hours resulted in increased production. His experiment and his deductions therefrom, have been corroborated wherever a similar change has been made.

It is frequently found that workers of all kinds say, and indeed believe, that what goes on around them does not affect their power to work. Carefully conducted experiments, however, prove that noise, bustle, and apparent confusion, have distracting effects on the attention, even though the worker himself may not be conscious of them. In a printing establishment, a woman, presumably a proof-reader, was seated near an aisle in a busy and noisy work-room. When she was removed to a quiet corner it was found that her work had increased 25 per cent. It seems fair to suppose that the distractions which break the continuity of attention even in small ways which do not rouse pleasant feelings must be constantly counteracted by a nervous expenditure, which may not be noticeable to the worker, but which like the internal friction of a machine, burns up fuel and is, from an economic point of view, simply waste.

Again to return to the modern business man, factory head or professional worker, and applying to his case the same reasoning that fits the case of those whose work contains more drudgery, we find that he, like them, is affected by his surroundings. He is amenable to distractions and that he often has to force his mind to work while he carries other handicaps which his responsible position forces on him.

Nature's Aid—Semi-Reflex Action.

In all this, nature has lent us a helping hand. It is the tendency of all constantly repeated actions to become partly automatic. Men of science call this class of action "semi-reflex." The following is an example of pure reflex action. As an example take that which results from the entrance of a cinder or piece of dust into the eye. The lids close tightly and a copious flow of tears tends to wash it out. The act is involuntary and like other pure reflex actions usually is of service to the individual. Habitual performance perhaps prolonged or lengthened into a series involving several distinct actions, runs along without affecting the mind. The sensation produced by a completed muscular action is sufficient to start the next and so on through the series, the intellect taking note only of the final result. The mind is thus set free to a very great extent, and in this way a natural economy is brought about so that the mind may go on practically uninterrupted with its own more important work.

An example of semi-reflex action, in which the mind acted incompletely by over attention to its own immediate business, lately came to the knowledge of the writer. A lady who was a most diligent and excellent housekeeper was in the habit of making a daily round of the cellar in order to bring up with her the things she needed for the day. It was her custom in the dark mornings of the winter to turn an electric switch as she went down the cellar stairs. The turning of the switch lighted several electric bulbs, so that her inspection of the larder was made in a full flood of light. On coming up the cellar stairs, she invariably turned the switch and extinguished the bulbs. As the mornings got brighter with the advance of the season, and daylight streamed in through the cellar windows, the lighting of the bulbs was consciously omitted at first, but later became semi-automatic. On coming up the cellar stairs, and in conformity to habit, the electric switch was turned so that the bulbs were made to glow. This went on for several days before it was discovered. In the last case we have a sort of semi-reflex action in which the lighting of the bulbs was purposely omitted, but the flood of daylight was not consciously noticed by the mind closely occupied by household matters, and the last act of the series was automatically performed, without conscious knowledge that the whole lighting process had now been reversed, and that electric lamps were left alight when the lady was not in the cellar. Her known carefulness about details shows that the act had not been noticed owing to its semi-reflex character.

This occurrence perhaps gives a hint of how some kinds of mistakes, made by otherwise thoughtful persons, may occasionally take place. At any rate it shows Nature's effort to liberate the mind from the abstractions, which while inevitable, do not form an essential part of the business to be done. Acts which do not reach the threshold of conscious perception are in the nature of an intellectual economy which nature has provided, that we may do the work we set out to do.

This intellectual economy, if one may say so, seems to be more like a sort of temporary postponement of fatigue, and not a removal of its cumulative effects. There are constantly showered on the organs of sense, innumerable impressions which are each one "handled" with great promptness. Each one is forwarded to the brain whether or not it is pertinent to the matter in hand. The mind cannot deal with or act on all these, though as Prof. William James tells us, "All mental states (no matter what their character as regards utility may be), are followed by bodily activity of some sort. They lead to inconspicuous breathing, circulation, general muscular attention and glandular or other visceral activity even if they do not lead to conspicuous movements of the muscles in daily life." It is clear that constant yet unobserved bodily action is really taking place, and it is probable that this effect together with prolonged effort of will required to hold the attention on the work before us is what makes us grow tired and ultimately fagged out. This is in addition to the fatigue of the brain itself, viewed as an organ.

Brain Fag.

In view of a great deal of available evidence it does not seem as if the brain alone become so tired as to halt at its work. There are so many other circumstances of an undesirable nature surrounding protracted work that the cumulative result of their effects would seem to be in great measure the real cause of a break down. A sort of rough analogy is presented by what is known on a railway as an "engine failure." This is practically that if a train be stopped anywhere, at a station or on the road and cannot move forward again after four minutes when the operating department is ready, the detention is booked as an engine failure. In any list of such failures, the derangement of the headlight would likely cause an insignificant proportion of the total, while "leaky flues" would probably amount to a considerable number, especially in bad weather. Pure brain fag is not likely often to occur amid pleasant and advantageous surroundings as it is when accompanied with resisted and detrimental stimuli.

Brain action, especially when continuous, makes a heavy demand upon the blood supply and the surroundings of a man engaged in brain work are too often

INFLUENCE OF OUR SURROUNDINGS.

A good many men think themselves unaffected by their surroundings, and though their homes are comfortably or even artistically furnished, their offices are generally bare and unattractive, and are without many minor conveniences. The consensus of scientific opinion to-day is that man is most decidedly affected by his surroundings. Instances are not wanting in which the presence of a few flowers has added to the pleasure or the contentment of the workers in a factory, and this feeling is not without its commercial value.

such that he is unknowingly endeavoring to make the best of adverse conditions, in which want of exercise, noise, bad ventilation, dusty germ-laden air, bad light, confusion, interruptions, undesirable personalities, distractions, set hours, disappointments and the failuse of others to meet expectations, all add their quota of discomfort. All this becomes accentuated if the man be engaged in the technical and laborious monotony of high grade work, such as checking the strain sheet of a cantilever bridge.

It is not unusual to hear a man thus conditioned sigh for rest or at least for quiet where he can work in peace. Work itself is not distasteful to the average man, and he is indeed to be pitied who would desire to do nothing. Munsterberg has pointed out that even monotony in work is not necessarily more fatiguing than variety. In fact, habit, as Prof. James says, is the great flywheel of society. It prevents the hardest and most repulsive walks of life from being deserted. It even keeps different social strata from mixing, and it makes each individual fight out the battle of life upon lines he is accustomed to, rather than risk a change or seek the temporarily unknown.

The Hobby Feature.

What, say you, has all this to do with the value of a hobby? Simply that whether or not a hobby is useful work for the world, its value lies very largely, if not wholly in the fact that it affords an opportunity for a complete change, not only in the character of the work done, but in the bodily surroundings, and "change of scene," or "change of air." Dean Swift worked and strove to obtain the mitre. His real ambition lay in the direction of ecclesiastical advancement. He wrote simply as a pastime, but the world knows him only as a man of letters and a wit.

Hobbies of Prominent Men.

Even when the "work" entailed by a hobby is what most men call play there is the absence of "strain." Arthur Balfour, formerly Premier of Great Britain, was recently called from a tennis match at Cannes to speak in the House of Commons on Irish Home Rule. Balfour is an enthusiastic golf player; yet no one will say that the surpassing of "bogey" has any "survival value" for the world at large. It is also certain that less accomplished players approach the links with feelings of pleasant anticipation.

The "work" has in it all the theoretical elements of monotony, yet no such condition is usually experienced. There is pure air, sunlight, exercise, quiet, congenial companions, absence of hurry and distraction, with all that goes to make what we call enjoyment. These things when analyzed produce healthy activity of the body, and if it were possible to work in the office amid the same surroundings as those of the tennis court or the golf links, it is more than probable that business would have much the same effect, apart from actual brain fatigue, for the pursuit of some game, regularly played, placed it in the class of hobbies.

Lord Avebury (Sir John Lubbock), was a banker in "school hours,' but he made a hobby of the painstaking study of ants, bees, and wasps, and has not only written extensively on the subject, but has brought to light many interesting and scientific facts. It is needless to say that his off-time work has been carried on so as to produce, even while accompanied by the closest attention, and a high degree of concentration, the very opposite results from that occasioned by unremitting attention to business, amid the harassing distractions and interruptions of the office.

HABIT.

Habit is the great flywheel of society. It prevents the hardest and most repulsive walks of life from being deserted. It even keeps different social strata from mixing, and it makes each individual fight out the battle of life upon lines he is accustomed to, rather than risk a change or seek the temporarily unknown.

The late Lord Salisbury was an amateur chemist, when the affairs of state did not engross his attention, and he, like Lord Avebury, was compelled to pursue his labors with the same patience as that required by many an office drudge.

John Tyndall, the famous physicist, was during his lifetime, an enthusiastic alpine climber, and made many valuable observations on the movements of glaciers, and the flora to be found at high altitudes. His work was, of course scientific in scope, while it did for him what the more or less unproductive relaxations do for other men.

Writing was Elbert Hubbard's hobby until he found it to be a live horse, and rode away on it. He has now two magazines, The Philistine and The Fra, in which he and his contributors say their say without fear or favor.

Henry Ford, he of the "Ford Car," has made a hobby of bird life, and has probably done, and is doing more to protect birds and to encourage those who bring desirable species to the United States, than any other single agency. These hobbies are in no sense, fads. They have a double use. They promote the health and happiness and therefore the well-being of the man who has them, but they do good to others.

Andrew Carnegie, to whom in early life books were a priceless treasure, has made a hobby of libraries. He seeks to freely give what was once so difficult for him to obtain.

The famous John D. Rockefeller has taken up forestry and good roads as a twin hobby.

The activity of these two men proves that the mind needs exercise, as well as do the limbs. Neither of these men is compelled by any ordinary consideration to work as the majority of people work. There is in all states an imperative necessity, inherent in the mind itself which demands some form of employment, and the so-called "idle rich" can no more escape from the operation of this universal law, than he can, who toils for a daily wage.

William T. Noonan, president of the Buffalo, Rochester & Pittsburg Railway, is a lover of horses, and has many an early ride before business hours. Perhaps one might say he has made a hobby of health.

Frederick D. Underwood, president of the Erie Railroad, is a collector of watches.

Caruso is a caricaturist of some artistic skill.

Theodore Roosevelt is a faunal naturalist.

It is not necessary to suppose that these men's offices are unpleasant or dark, or filled with disturbing noises. There is no doubt that they, like all conscientious workers, are subject to the same distractions in their business hours, that come unbidden from without, and invade the working mind. These distractions set up "states of consciousness," and produce the unnoticed bodily activity, and the constant automatic repression of them, so that brain work may be unhindered, uses up nervous force.

King George V., is a stamp collector in his private life.

Joseph Chamberlain, the lately retired British statesman, is an orchid grower.

Paderewski raises chickens, while Frederick Phinney's hobby is the collection of gems.

John Paterson, of the New York Central, has made health his hobby, and William C. Brown, formerly president of the same road, is a farmer in his spare time.

James J. Hill collects pictures, while the late J. Pierpont Morgan was a most successful and discriminating collector or rare books, pictures, and objects of art.

A. M. Todd, of Kalamazoo, Mich, is

a book collector, and now has many thousand volumes.

John D. Archibald steers his private yacht daily to and from business in order to obtain that variety which is the very spice of life.

The wear and tear of office life is undeniable, and the many distractions, to which we have referred above, and the multitudinous sense impressions which constantly invade the mind of the brain worker, are to a great extent automatically repressed by nature, as one of her economies. Nerve force must, however, be expended in the constant repression of sensations so that they may not reach the threshold of consciousness. This constant output of power may not at any moment be noticeable, but it is there, and its effects are among the things that persist.

Primitive man was not hampered in the same way as we are, for like a child he gave way to every gust of feeling and was ever in a state of change. Nature repressed much for him, and in the same way as it does for us, but he was free from the effort of continuous and steady application to a single line of abstract thought. We are the result of evolution, and even fortified by the effects of our somewhat artificial training and our abnormal heredity, we must still, in some form, "get back to nature," and the beneficial effects of the pursuit of a hobby as a means of approximately attaining that end, has raised it above the level of a mere pastime to that of a serious and scientific necessity.

COMPARATIVE ECONOMICS OF TRAMWAYS AND RAILLESS ELECTRIC TRACTION.

By T. G. Gribble, M.Inst.C.E.

THE RAILLESS electric traction system, otherwise designated the "trolley-bus," or "trackless trolley," already forms in several cities an extension to the tramways system, and the applications to Parliament for the authorization of similar lines are numerous. The purpose of the paper read before the Institute of Civil Engineers is to discuss the various economic features of the system, as compared with those of tramways, with a view to the definition of the sphere of usefulness which is open to the former.

The initiation of the system, in contrast with the general history of new forms of transportation, is due, not to Government aid or private enterprise, but to municipal tramway committees, and it is pointed out that the Light Railways Act has failed to effect what was intended by it, and in contrast, attention is drawn to the immense and profitable development of light railways in Belgium.

The necessity for the further utilization of the highways is urged, because of the centralization and congestion of population which has resulted from the development of the railway system. The distinctive economic features of tramways and railless electric traction are defined, and an analysis is made of the statistics of British municipal tramways, both as to cost of construction and working expenses.

Railless electric traction is compared with the tramway as to carrying power, capital expenditure and working costs, by means of generalizations deduced from the above statistics. These generalizations are in the form of curves and tables, while the working expenses are analyzed in a table. Attention is drawn to the great variation in the cases cited of the cost of energy, greater than can be accounted for by the price of fuel. Cases are added of foreign tramways which operate with trailer cars.

An illustrated description is given of tests made by the author of current consumption on an electric omnibus propelled by means of accumulators on London streets, also of tests made on a railless electric car at Bradford. The general conclusion drawn is that it requires no more current to carry the passenger by railless electric traction than it does by a tramway. The maintenance of rubber tires is touched upon in regard to the principal causes of wear and tear, and of the effect of tropical climates.

The subject of the responsibility for the upkeep of public roads is dwelt upon at some length, in view of the altered conditions resulting from the introduction of mechanically propelled vehicles, and the present necessity of special Acts of Parliament for the authorization of railless electric lines is represented as a hardship which calls for relief at the hands of the Legislature.

The comparative economics of tramways and railless electric traction are finally embodied in three diagrams, arranged to show the respective capital expenditure and working expenses under analogous conditions for services of different traffic density, ranging from a service of 30 minutes' interval to one of 2½ minutes.

Conclusions.

The general conclusions are:—

(1) That with a traffic density represented by a 2½-minute service—that is to say, that of one of the largest tramways—the economy of construction and operation is still in favor of railless electric traction; as to the cost of operation by about 7 per cent., and as to cost of construction by about 44 per cent.

(2) That the economy increases inversely with the traffic density; so that with a time interval of 30 minutes the economy of operation is about 36 per cent., and that of cost of construction about 70 per cent.

Reference is made to the York tramways, the most recent case of a municipal tramway, in support of the argument that an even more important point than that of saving of expenditure is the possibility, by means of economic transportation, of serving the suburbs and the rural population. It is argued that the tramway at York, 6 miles in length, excellent though it is, does not serve all the suburbs, and that, by means of railless electric traction, for the same capital expenditure, 16 miles might have been constructed and operated; thus completely reaching the extreme suburbs, and incidentally raising the value of property in the vicinity of the city.

A tribute is paid to the enterprise and initiative ability of the leaders of municipal tramways in having taken up the burden of experiment and proof of the system which seems to them the normal form of extension of their tramways.

COMING CONVENTIONS.

Master Boiler Makers' Association. — Philadelphia, May 25-28. H. D. Vought, secretary, 95 Liberty Street, New York.

Master Car Builders.—Atlantic City, June 10. Joseph W. Taylor, secretary, Karpen building, Chicago.

Railway Electrical Engineers.—Atlantic City, June 10. J. A. Audreucetti, secretary-treasurer, C. & N. W. Ry., Chicago.

Railway Supply Manufacturers' Association.—Atlantic City, June 10-17. J. D. Conway, secretary, 630 Oliver building, Pittsburgh.

American Society of Mechanical Engineers.—June 16-19, Minneapolis (headquarters at University of Minnesota). Calvin W. Rice, secretary, 29 West Thirty-ninth street, New York.

American Institute of Chemical Engineers.—Troy, N.Y., June 17-20. J. C. Olsen, secretary, Brooklyn Polytechnic Institute, Brooklyn, N.Y.

Railway Master Mechanics.—Atlantic City, June 15-17. Joseph W. Taylor, secretary, Karpen building, Chicago.

American Society for Testing Materials.—Atlantic City, June 30-July 4 (headquarters Hotel Traymore). Prof. Edgar Marburg, secretary, University of Pennsylvania, Philadelphia, Pa.

Railway Tool Foremen's Association. — Chicago. July 20-22. A. R. Davis, secretary-treasurer, 730 Pine street, Macon, Ga.

Railroad Master Blacksmiths. — Milwaukee, August 18-20. A. L. Woodward, secretary, C., H. & D. Railway, Lima, O.

American Foundrymen's Association. — Chicago, September 7-10 (headquarters Hotel LaSalle). A. O. Backert, secretary, Penton building, Cleveland.

Railway Bridge and Building Association. — Los Angeles, October 20-22. C. A. Lichty, secretary, C. & N. W. Railway, Chicago.

Bridge and Building Supply Men's Association. —Los Angeles, October 20-22. H. A. Nealy, secretary, Joseph Dixon Crucible Company, Boston.

Railway Electrical Manufacturers' Supply Association. — Chicago, October. J. Scribner, 1010 Monadnock building, Chicago.

With vanadium steel dies punching 90,000 punchings are said to be secured in making gaskets from unpickeled sheet steel. The best production formerly obtained with ordinary tool steel dies without regrinding was 40,000 punchings.

SYSTEMATIC BUSINESS MANAGEMENT

Practical Articles for Managers, Superintendents, and Foremen, to Assist in Carrying on the Business Economically and Efficiently.

EFFICIENCY ENGINEERING.

AN unusually interesting and practical address on "Efficiency Engineering Applied to Mines, Quarries and Industrial Plants" was delivered recently before the Canadian Mining Institute at Montreal, by Mr. H. M. Payne, of New York. It was racy, but it was highly sensible. Mr. Payne impressed on his hearers that gaining, in a commonsense way, the co-operation of employees was a prime requisite of efficiency engineering.

"I wish," he said, "that there were in the English language such a phrase as efficiency engineering. I am ready to grant that this method of scientific management can be applied, with the refinements of cruelty, to stop-watches, but the efficiency engineering I propose is to eliminate all red tape, and to humanize the engineer's work. A man's time and skill can be bought, but his co-operation cannot be bought. My idea of efficiency engineering is not a colorless standardization, but rather an emphasized individuality."

CONDUCT RULES BY JAPANESE NOTABLE.

THE late General Nogi, who enjoys the unreserved admiration of the Japanese, on the night of the funeral of the late Emperor, issued a note of disciplinary instructions for the pupils of the grammar grade of the Peers' School. The note contains fourteen instructions, and truly reflects the spirit with which the late general led the pupils of the school. The gist of the instructions is as follows:

Keep your mouth closed. He who has always his mouth open shows that his mind is blank.

Mind what you are looking at. One whose eye is always wandering tells that his mind is also wandering.

When paying your respects, look at the person whom your are saluting.

Do not forget your coat-of-arms, family standing, and ancestors. Due respect to your ancestors is important.

A boy should act like a boy. Avoid becoming effeminate.

Never indulge in luxury. There is nothing that makes a fool of a man like luxury.

Ride in rikishas as little as possible. Even if a riskisha is sent for you, try to walk home.

How many of you wash your face with cold water in the winter? You should not use warm water.

When it is cold think it is hot; and when it is hot think it is cold.

It is a shame to wear torn clothes without mending them, but to wear the torn part patched is nothing to be ashamed of.

Know what is shame; he who does not know what is shame is inferior to dumb animals.

While in good health, train yourself so as to endure physical labor. When you are ill, however, obey your physician's instructions.

Make your clothes and shoes bigger. Never mind the style or shape.

Become a man useful to your country. Whoever cannot be so is better dead.

BRINGING EMPLOYEES UNDER OBSERVATION.

THAT scheme of the Canadian Pacific Railway Co. to discover the good and bad points of its employees, with the idea of rendering more adequate justice to the individual, is creating interest on the big American systems. It was the origination of Mr. Grant Hall, general manager of the western lines, with about 40,000 employees under his direction. Sir Thomas Shaughnessy, at family banquets has, before now, expressed regret that good men might be overlooked, notwithstanding the fact that the company was on the keen lookout for the men who were to come after the present officers. It has been felt that while the men close at hand could be measured as to capacity, the thousands at a distance, working on all parts of the line, extending for thousands of miles, might be overlooked in spite of the most undeniable qualifications.

Mr. Hall appoints trustworthy persons who shall go over the western system regularly, watch the men, themselves unsuspected, and report, not their bad, but their good qualities; how they do their work; how they conserve the interests of the company; how they show their zeal. If bad, things must be reported, those against whom the black mark is made will have a chance to be heard before judgment is rendered. In this way, it is believed the merits of the men will be more certainly discovered, and, being discovered, promotion will follow upon the discovery—when that is possible.

The idea, which is even now being put into effect, is regarded by the big American systems as at once novel and excellent. The wonder is that it was not tried before. The men who are at the elbow of the president or at the heads of departments are, of course, noticed and promoted, which may be just enough; but those who are not seen, have not the same chance and yet they might be just as capable as the more favored ones.

This has been felt to be a grievance from the beginning; but a grievance which could not, apparently, be remedied. Mr. Hall has found a way. He brings each employee close by the report he will receive respecting him. Of course, the investigation which the secret inspector can make must necessarily be superficial; nevertheless, it will have value. They can see where there is courtesy; a willingness to help; zeal for the service; and these enter into character.

ANALYZING AND CHARTING YOUR ORGANIZATION.*

By A. R. Rosenblatt.

IT is one of the inefficiences of many large organizations that executives either do not know or will not admit the abilities of minor employees to fuller recognition. Clerks are permitted to go on clerking for year and years without any attempt being made to utilize in other fields of knowledge of the business which they have accumulated. Worse yet, latent abilities which many minor employees possess are permitted to go unused to the detriment both of the house and the employe.

So many men and women drift into the first job that comes to hand out of sheer necessity. They haven't the time or opportunity to analyze themselves, to find wherein their greatest strength lies, and to seek until they obtain the post that offers the best opportunity for the good work they are best fitted for. There is to-day more waste in potential human ability by workers and employers than there is waste of material, and as the majority of young workers do not stop to analyze their possibilities, it is up to the employer to do this and see that the knowledge and ability of his organization is developed and used, for the mutual benefit of employed, employer and the work itself.

There are many live firms who are constantly doing good analytical and edu-

*From an article in the Efficiency Magazine.

cational work among employees in this direction. One concern, for example, has a plan for classifying and recording every employee immediately upon entry into the organization, under the following headings, the basis for decision being the employee's own account of himself, experience, habits and the impression produced in an interview:—

(a)—Physically strong vs. Physically weak.

(b)—Mental strength vs. Inclination to manual labor.

(c)—Settled vs. Roving temperament.

(d)—Indoor vs. Outdoor workers.

(e)—Directive vs. Dependent nature.

(f)—Originality vs. Imitativeness.

(g)—Detail vs. Large-plan men.

(h)—Adaptability vs. Obstinancy.

Such information is an excellent index to determining whether the individual is applying for the job for which he is best fitted, or whether he would not be more efficient in another post.

Another house keeps permanently a chart for each employee. This records in one column the individual's own estimate of his qualities, abilities and characteristics upon entering the organization, and is checked from time to time by recording his actual performance. This chart lists such factors as—

Physical Characteristics.

Age, height, weight, appearance, general health, and any defects of sight, hearing, etc.

Mental Qualities.

Education, experience, concentration, observation, memory and what specific ability ever manifested—in mechanical, artistic, literary or scientific directions?

Character.

Industry, truthfulness, decision, thoroughness, carefulness, enthusiasm, loyalty, morals, aggressiveness, self-confidence, patience.

If a correctly kept chart of this kind were available to every executive, he would find it possible to draw from his own organization unlimited means for development of business and of the individual.

MACHINE DICTATION VS. STENOGRAPHERS.

ONE of the most exacting and convincing tests of the efficiency of dictation machines, in comparison with the stenographic method of handling correspondence, has been made in the office of a well-known Massachusetts concern.

In this test the precise number of words written within a given time was recorded, through the medium of a timekeeper, who made an actual count of the production of each employee. The test extended over six days and a record was kept of the work of nine stenographers and four dictation machine operators, all of whom were regular employees of the company conducting the test, consequently all were equally familiar with the work. The four dictation machine operators were under a handicap, as all four were novices in the use of the system.

The result of the test showed that the nine stenographers working 11,478 minutes during the six days on this particular kind of work turned out 219,128 words, or an average of 19 words per minute, while the dictation machine operators, working 11,865 minutes, in the same six days turned out 341,571 words, or an average of 29 words per minute.

In other words, under the dictation machine system with only 44 per cent. of the working force, 122,000 more words were written in one week, or 10 words more per minute.

ANALYZING SCIENTIFIC MANAGEMENT.

SCIENTIFIC management is being investigated by the Industrial Relations Committee at Washington, and well-known efficiency engineers and labor men had an opportunity to give their individual viewpoints on this much discussed system. According to the New York Evening Post, the following points at issue were clearly developed:—

The idea of the whole movement, according to Frederick W. Taylor, is to increase the comfort and well-being of the workers. Under his system, he declares, thousands of men are getting higher wages every year—steadily growing more prosperous. That is the inevitable result, according to Mr. Taylor. The saddest thing in the whole industrial world, he told the commission, is the idea now prevalent among working men that they should curtail their productivity, or "go slow." What the workers need is more goods, and where will goods come from if the workers do not produce them? he asked. It was to meet this situation that the idea of scientific management was developed.

Carl C. Barth, a consulting engineer of Philadelphia, declared that he would have no objections to unions if the union leaders would come to him for instructions and study the system for two or three years before they demanded the privilege of having a voice in its development.

Labor Leaders Suspicious.

Thus, olive branches, or twigs at least, were held out to organized labor by the efficiency engineers. Nevertheless, the labor men did not seem to be impressed. They were frankly suspicious of the whole movement. All of the reports that came to them from the employees where the experts had had their way were exactly contrary to the opinions expressed by the experts themselves. Instead of liking the system, they declared that the men were opposed to it in every case. They declared that it was just another scheme of speeding up the workers and getting more profits out of them. They did not think much of a scheme that was going to double production of the workers, and they frankly stated that they had no confidence in Mr. Taylor's statement that there would be work enough left for all of them.

In answer to the engineers' criticism of the labor unions that they had not tried to understand scientific management, the unionists retorted that the experts had never tried to explain it. "If these men believed in collective bargaining, as they say they do," said A. G. Berres, secretary of the metal trades department of the American Federation of Labor, "it is peculiar that they have never knocked at the door of a labor convention and asked an opportunity to explain their system. They have never even gone to a local body and asked for a hearing."

The thing that was evident throughout the hearing was that it will take a long time of fair dealing to blot out a suspicion that has been engendered in the minds of labor men by the speeding methods under the old piece-rate system which involved frequent cuts in the rate. It was evident, too, that the efficiency engineers are better engineers than they are economists, for it developed under the questioning of members of the commission that the only assurance they offer that the wage rate will not be cut under their system is that such a procedure is in the long run unwise and very unscientific. They seemed to insist that they had found a solution for the conflict between labor and capital over the division of profits in industry, but they were unable to explain either how capital could be induced to pay and keep on paying what is "fair" or how labor could be induced always to be content with that and never ask more.

Brandeis Would Start With Unions.

These difficulties were faced more frankly by Louis D. Brandeis, who was the last advocate of scientific management to appear before the Commission. Mr. Brandeis would start with organized labor instead of introducting the system first and then attempting collective bargaining. Labor will not be safe at any point, Mr. Brandeis stated, either at the time of the introduction of the system or when it is under way, unless it is organized and able to insist upon a consideration of its views.

Mr. Brandeis believed that some of the experts had been at fault in not

(Continued on page 532.)

Arithmetic for the Machinist and Workshop Operative

By J. H. Rodgers

With the further development of this course in arithmetic, it will be found by those who have followed the introductory lessons and profited by them that the various practical applications resulting from the succeeding lessons will be easily observed and their time and labor-saving features so appreciated as to be adopted at every available opportunity.

MENSURATION.

MENSURATION is that branch of geometry which treats of the measurements of lines, surfaces and solids.

The area of a surface is the number of unit squares it contains, usually expressed in square inches, square feet or square yards.

The expression sq. inches, should not be confused with the expression inches square; for instance, while an inch square would represent one sq. inch, the expression—3 inches square means a square figure that measures 3 inches on a side, and would represent 3×3=9 square inches.

The area of any triangle equals one-half the base multiplied by the height.

The area of any irregular figure bounded by straight lines can be found by dividing the figure into triangles and finding the area of each separate triangle; the sum of all the triangles equals the area of the figure.

To find the circumference or diameter of a circle.

Circumference equals the diameter multiplied by 3.416, and diameter equals the circumference divided by 3.1416, or by the formula (Chart 18:

$$p = d \times 3.1416 \text{ or } d = \frac{P}{3.1416} = .3183p.$$

The area of a circle equals the square of the diameter multiplied by .7854 or by formula

$$A = \frac{Nd^2}{4} = .7854d^2$$

Example:—A certain belt has a speed of 1,250 ft. per minute, what is the diameter of the driving pulley if the speed of the driving shaft is 160 revolutions per minute?

The circumference of the pulley will be the surface speed in inches, divided by the speed of the shaft, or

$$\frac{1250 \times 12}{160} = \frac{375}{4} = 93.75 \text{ inches, then}$$

$$\text{diameter} = \frac{93.75}{3.1416} = 29.8 \text{ ins., or a}$$

30-in. pulley.

Example:—If the mean effective pressure in an engine cylinder be 65 lbs. per sq. in., and the diameter of the piston is 16 ins., what is the total force acting on the piston?

The total pressure will be the pressure per sq. in. multiplied by the area of the piston, or $65 \times .7854\ d^2 = 65 \times .7854 \times 16 \times 16 = 13{,}069$ lbs., or 6½ tons.

To find the diameter of a circle when the length of a chord and the height of the segment are known. (See Chart 18.)

The height is to half the chord as half the chord is to the diameter minus the height. h : .5c = .5c : a

or diameter = [(.5c)² ÷ h]+h.

Example:—To find the diameter of a broken flywheel. (See Chart 19.)

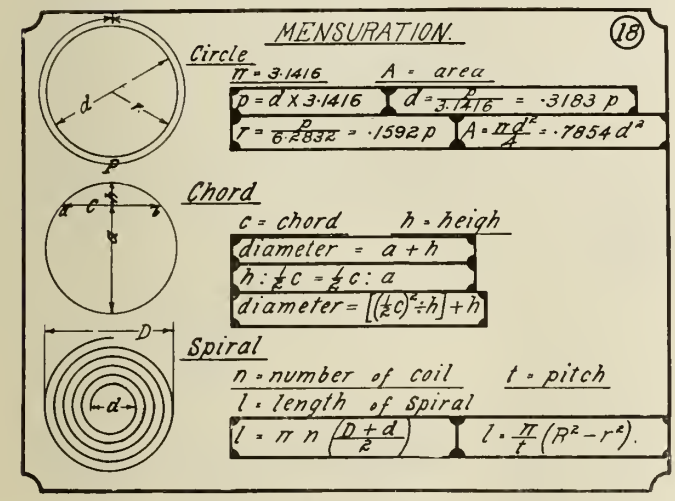
This may be obtained either graphically or by calculation. Select three points (a) (b) (c) upon the rim of the broken section; then with radius greater than half the distance a.b.) describe arcs intersecting at (f) and (g). Similarly from (b) and (c) describe arcs intersecting at (d) and (e). The production of these bisecting lines will intersect in the centre (o).

By calculation: If in the broken section (Chart 19), the length of the chord (1—2) equals 18 inches, and the height (3—4) equals 1.125 inches, what is the diameter of the flywheel?

By formula:—

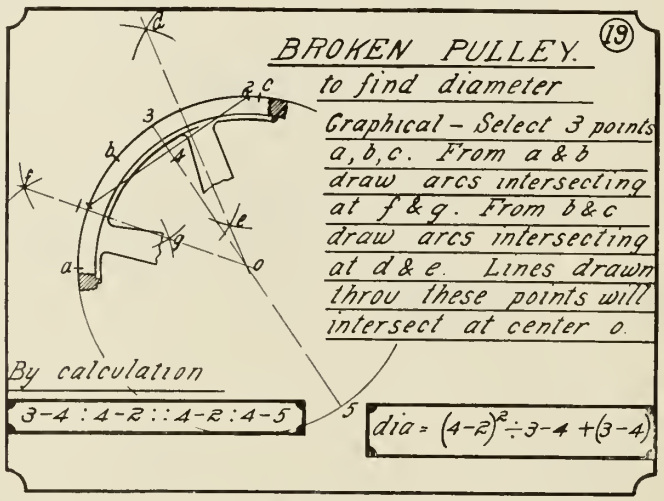
diameter = [(4-2)² ÷ (3-4)]+(3-4) or (9² ÷ 1.125)+1.125 = 73.125 inches.

To find the length of a spiral.



Multiply one-half the sum of the large and small diameters by 3.1416 times the number of coil.

Example:—Large diameter of a roll of belting measures 15 inches, the inner diameter 3 inches, and the number of coils equals 24; what is the approximate length?



By formula: $t = \pi n \left(\frac{D+d}{2}\right) =$

$$3.1416 \times 24 \left(\frac{15+3}{2}\right) = 678.61 \text{ in. or}$$

56 feet 6 inches.

ARITHMETIC CHART 18.

ARITHMETIC CHART 19.

Pulp and Paper.—In pulp and paper circles it is thought that a profitable business in the Orient may be developed by the pulp and paper mills of British Columbia. At present a number of these mills are closed down, but it looks as if there might be a steady development in many lines of business with Southern Asia, China and Japan.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

ARRANGEMENT OF STOPS FOR TURNING ON THE LATHE.

By Frank H. Mayoh.

ON THE average engine lathe the question of some means to automatically stop the carriage when turning lengths or facing shoulders is a baffling one inasmuch as these lathes are not usually fitted with stops, or at the most but a single one is provided.

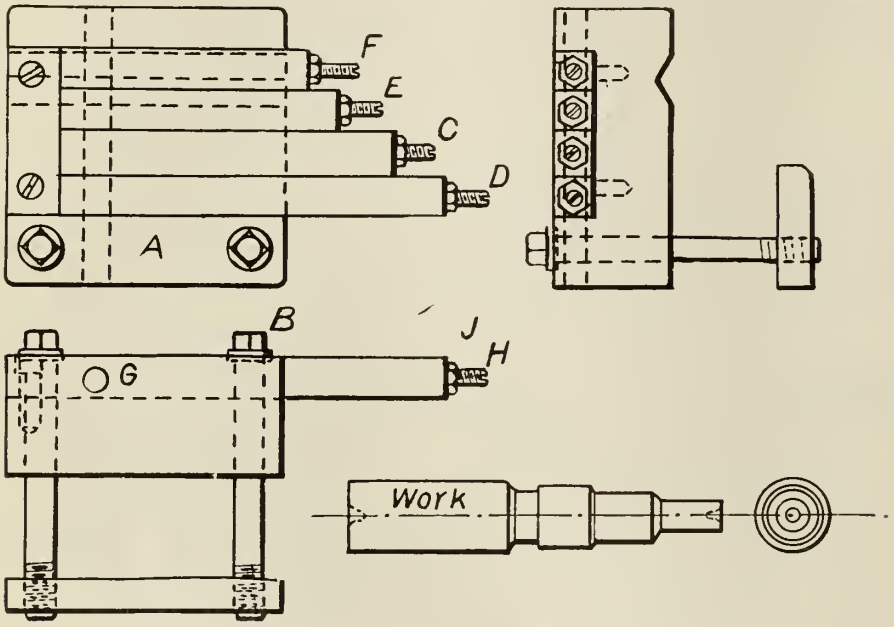


FIG. 1. DETAIL OF STOPS FOR TURNING ON THE LATHE.

In dealing with work similar to that shown in Fig. 1, it will be seen that to measure each length as required for each step on each piece would be quite a problem, and a laborious process. To get over this, the stops shown in place on a lathe carriage slide were devised.

The device consists of a bracket A (which is also shown in Fig. 2), fastened

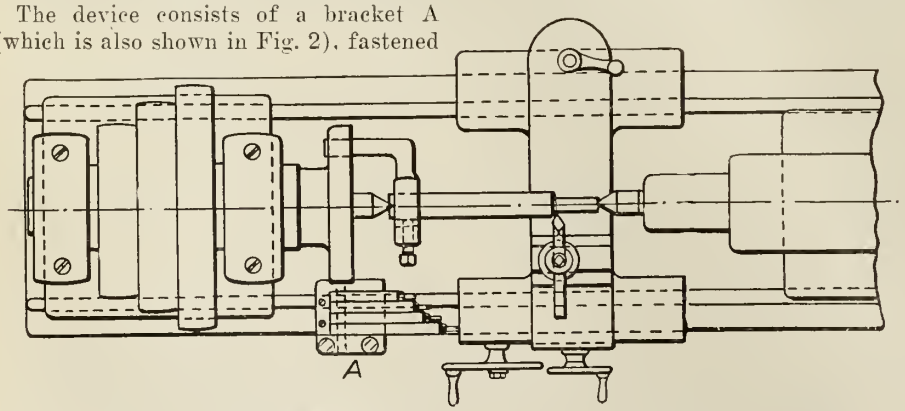

FIG. 2. ARRANGEMENT OF STOPS FOR TURNING ON THE LATHE.

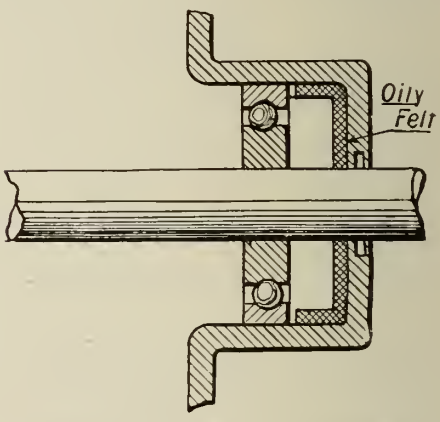
to the side of the lathe in a manner similar to a clamp by the two screws B. In this bracket there are mounted four blocks of various lengths, viz: C, D, E and F, which are swung on the pin G, and carry setscrew H and the necessary check nuts J. These are used as follows:—

When starting to turn the piece indicated in Fig. 1, all the swinging stops are down parallel with the slide as shown. It will also be noticed that the stops are of different lengths. Starting to turn, we proceed until the lathe carriage reaches the first stop, which is D—all of the stops having previously been set to the correct length by a scale before starting to cut. Lifting the end of this stop, it is swung on the hinge pin through about 120 deg., until it rests upon the edge of the bracket, where it is out of the way. We now proceed to the second step and turn up to the next stop, C, which is shorter in length, and so on with stops E and F until the piece is completed. The same cycle of operation is gone through on the remaining pieces, thus saving considerable trouble and eliminating the chances for error which the continual measuring and setting up or lack of proper stops always entails.



This device might be improved by putting square heads or in some way increasing the bearing surface on the ends of the studs.—Editor.

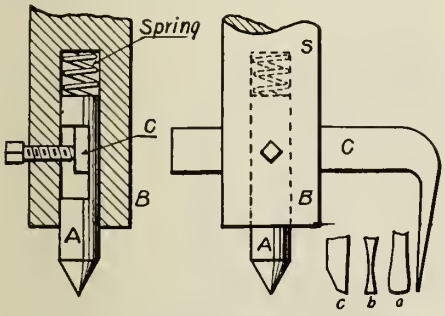
SCHEME FOR CATCHING DIRT IN BALL BEARINGS.

By N. G. Near.

TO keep dirt and grit out of your ball bearings, keep the balls covered with a thin coat of oil sufficient to prevent them rusting, and your principal ball-bearing troubles are eliminated.

Ball bearings are now made for almost every machine where minimum friction is desirable. For shafting transmission they are made particularly strong, rugged and durable. There are many varieties

CATCHING DUST IN BALL-BEARINGS.



of dirt shields for protecting the balls and races, some of them very effective, but to be absolutely sure that a minimum of dust will filter into the vital parts, it is a good plan to glue felt around the interior of the shield as shown in the sketch herewith and make it moist with oily graphite or other lubricant that will not dry. When a dust particle enters, it will be thrown against this trap by air currents set up by the rotating balls. Thus, whether the bearing is in use or not the dust particles have little chance to get to the surfaces where harm might be done. After several years of use the felt can be rinsed clean with gasoline.

CUTTING FIBRE WASHERS IN THE DRILL PRESS.

By A. V. Francis.

THE illustration shows a form of cutter used in the drill press for cutting fibre washers. There was not enough of this kind of work to warrant having dies made for each size of washer, so that an adjustable cutter became expedient. The shank B fits the drill press spindle or chuck, and is bored to relieve the centre A and a spring behind it. It is also mortised for a cutter bar C. The centre can either be cut away to go around the cutter bar or can be slotted to go each side of it.

If the washers be thin, a knife edge like (a) will cut them nicely when laid on a board, but if too thick for this, a cutting edge can be made as (b) with a rake and clearance like (c) to act just

CUTTING FIBER WASHERS IN THE DRILL PRESS.

as a cutting-off tool. The centre holds the sheet of fibre against the board on the drill-press table, and is forced into the holder as the cutting knife is fed down into the work. It will be readily seen that this form of cutter can be varied in many ways, any of which will no doubt answer the purpose.

An improved form of this apparatus is made with two cutters instead of one, so that the hole and periphery of the washer may be cut at the same time. The centre also is more easily made long and thin so as to go down into the work as the tool is fed. If the cutters be set at a slight angle with the circumference cut, the burring of material will be done to the scrap and the work will be comparatively smooth. Many other materials, such as mill board, friction paper, etc., can be cut with this fixture. —Editor.

MILLLING SQUARE CENTRES.

By J. Davies.

HERE is an interesting workshop problem which may be of interest to Mr. Rodgers of the "Workshop Arithmetic" series and others. It will serve to illustrate one of the many cases where shop arithmetic in a practical form could be of considerable help to the mechanic as well as serve to make his work more interesting.

The problem consists of setting up square centres for the lathe in the milling machine so that the angle across the corners will be exactly 60 degs. It is easily seen that the angle across flats is not the same as across the working edges. Most mechanics would accomplish this by the cut and try method while others would lay it off on the

MILLING SQUARE CENTRES.

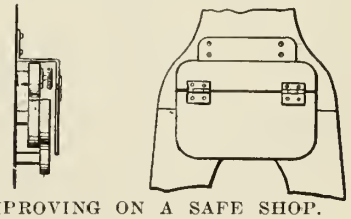
drawing board and transfer the angle; but very few could set the dividing at the correct angle to give the desired result with assurance.

This is a practical problem that I have been up against and thought it would be a splendid example to prove the value of workshop arithmetic.

AN ADJUSTABLE SQUARE.

By E. J. Charp.

THE accompanying sketch illustrates a very simple form of adjustable square. It can be set within a range of 10 degrees and, with careful designing and making of parts, will be as rigid as a solid square for all practical purposes.

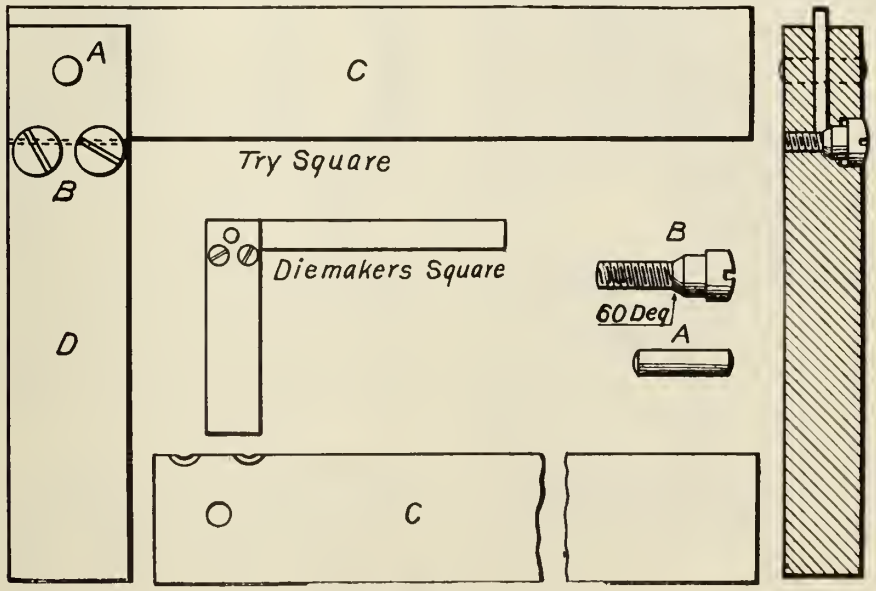


As will be seen, the blade C and stock D are made and finished separately, which greatly facilitates the grinding and truing operations. The blade pivots about the hardened pin A, which is made with a generous bearing surface. The locking and adjusting device consists of two special screws B, with shoulders beveled off at 60 degrees. The blade is similarly countersunk on the edge at the same angle to match the cone surfaces of the screws. All parts are hardened.

The object of this adjustment is not to produce a bevel protractor, but to provide a ready means of correcting the effect of accidents that will, as all mechanics know, happen to the strongest tools. The small square shown is a practical application of this tool to die work. The blade can be set to any desired clearance angle with little trouble, and can be rigidly held in this position.

IMPROVING ON A SAFE SHOP.

By D. A. Hampson.

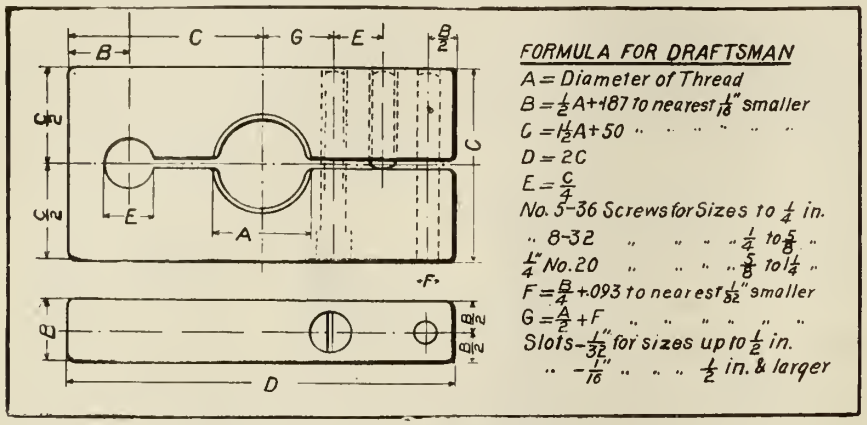


THE safety engineer left our shop as a completed job — completely "safetyized," but in some instances not very conveniently arranged. Among other things, the guards on the lathe change gears were made rigid and in one

IMPROVING ON A SAFE SHOP.

piece, which necessitated its being made large enough not only to cover the gears, but to permit their removal and replacement.

This arrangement was removed and a guard made as shown in the sketch. It is self-explanatory, and consists of a piece of ⅛ in. sheet iron bent in the shape of the letter Z and to which is hinged a loose flat piece of the same material. To change the gears, the flap is raised to a vertical position, where it remains just balanced. Should the operator forget to lower it, over-balance results, and it falls of its own accord. Thus, the safety expert succeeded indirectly in that his attempt stirred the gray matter of the ordinary mechanic.



AN ADJUSTABLE SQUARE.

DRAWING ROOM DATA SHEET.

By L. A. W. D.

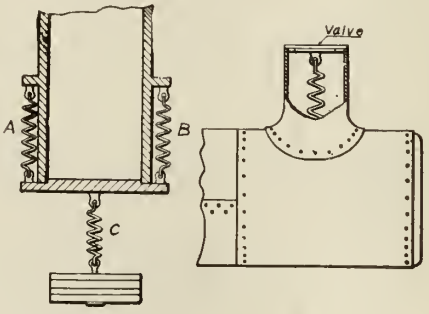
IT is well known that the average draftsman and tool designer in particular is not partial to compilations of formulae; still, the simplicity of the scheme herein illustrated should appeal to any designer. It is particularly useful for drawings of gauges, reamers, taps, or other tools which are similar in general form for a number of different sizes.

DRAWING ROOM DATA SHEET.

Two tracings are made, the one for the drawing room being dimensioned as shown in the sketch. These prints are made in loose leaf form to fit the notebook of the draftsman. The tracing for the shop is similarly made, except that in place of the formulae the blocked out space is left blank and the desired dimensions simply filled in on the blue print. As an example, a set of sizes for a ¾—10-thread gauge is here carried through. A=¾—10; B=.562; C=1.312; D=2.625; E=.328, nearest 1-16=.312; F=.1406, nearest 1-32=.125; and G=.50.

This system has been in successful use for four years by one of the largest automobile factories, and has been a large factor in the attaining of uniformity in shop tools.

TENSION ON CYLINDER COVER STUDS.



By C. N. Roach.

IN a former issue of your journal, Mr. Rogers proved to the satisfaction of quite a number of readers that if the studs were screwed up with a tension of 1,000 lbs. each and the full steam pressure, amounting to 2,000 pounds, be turned on, the total tension in the studs would be 4,000 lbs. This I do not altogether agree with.

In my opinion there can be no increase of tension on the studs when the steam is admitted to the cylinder. This theory I illustrate with springs as substitutes for studs and the steam pressure. If the cover be held in place with two springs, A and B, each under a tension of 1,000 lbs., the steam pressure can be readily represented by regulating the tension in the spring C.

If the tension in C be raised to 1,000 lbs., the tension on the other springs will still be 1,000 lbs. each. If raised to slightly more than 2,000 lbs., we will begin to note a deflection of A and B, as this will exceed their initial tension. This should corroborate the conclusions of Mr. Jones to the effect that the tension of cylinder studs does not increase until the total steam pressure becomes greater than the tightening up tension in the studs.

Another simple illustration is in the form of a boiler and safety valve. If there were any increase in the tension of the spring it would deflect and steam would blow off before the required pressure was reached. As the steel of the studs is more or less elastic if not seriously overworked, there is no reason why these cannot be cited as parallel cases.

TENSION ON CYLINDER COVER STUDS.

STRENGTH OF WIRE ROPE.

THE results of an investigation of the strength and durability of wire rope made by Prof. G. Benoit at the Technical High School at Karlsruhe, are recorded in a recent issue of Glückauf. The experiments were made with a patented cast-steel wire, 1mm. diameter, which showed a strength of 247,000 lbs. to 225,000 lbs. per square inch, with 227,000 lbs. per square inch guaranteed. The wire was tested singly and also twisted to a strand of seven wires, 3.1 mm. diameter, there being six steel wires and a core of a softer wire of a strength of about 122,000 lbs. per square inch. This rope withstood a pull of 1,770 lbs. The soft core did not break, but stretched considerably.

Three of the strands were then combined to form a rope of 6.8 mm. diameter, and five to form a rope of 8.5 mm. diameter, the latter with a hemp core. The wires and ropes were bent over a pulley through an angle of about 90 degs. at the rate of 1,000 turns per hour, the turn meanings the bending of the wire from the straight and then back to the straight again. The stress to which the wire under test was generally subjected was 11,200 lbs. per square inch. The single wires stood 198,710 bends, and twisted strand had one or two wires broken after 44,800 and 47,190 bends.

The first experiment was made with a pulley 6⅞ in. diameter, and a larger pulley was then substituted, 7⅛ in. diameter. On this the single wire stood 122,000 to 200,000 bends, while the twisted strand showed breaks in three wires after 40,860 bends. The cable of three ropes had one wire broken after 22,860 bends, and is said to have been destroyed after 36,440 bends. The five-rope wire began to fail after 35,000 bends, and was given up after 40,000 bends. The conclusions so far seem to indicate that twisting leaves considerable strains in the wire rope and especially in those of high-class steel.

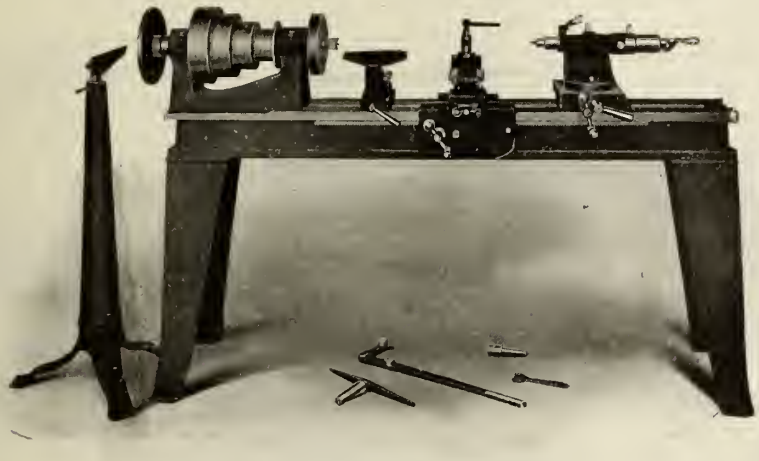
ANALYZING SCIENTIFIC MANAGEMENT.

(Continued from page 528.)

seeking an opportunity to explain their proposals to organized labor. On the other hand, the labor men have been at fault in condemning the system before they understood it.

"Scientific management offers the same opportunity to-day," said Mr. Brandeis, "as the opening up of Western land did fifty years ago. The existence of free land wasn't a solution of labor problems, but at the time, at least, it was a way out. Now the free land is all gone, and we are confronted with a new problem. Scientific management offers a new way out, but there is no possibility of a final solution so long as we have in juxtaposition political democracy and industrial absolutism. We can never curtail industrial unrest until the workers have a share in industry."

The D. E. Cleaton Co., Coristine Building, Montreal, Que., have been appointed sole agents for Canada for Henry Berry & Co., Leeds, England, makers of hydraulic presses.



DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

PATTERNMAKERS' LATHE.

THE description and illustration refers to a patternmaker's lathe recently brought out by the J. G. Blount Co., of Everett, Mass. The machine is of 16-in. swing with a 6-ft. bed.

The spindle is hollow and made from high carbon steel and runs in self-oiling bronze bearings. The outer end of the spindle is threaded for a face plate in order to turn work of large diameter, and a tripod rest is furnished to be used in connection with same. In addition to the usual hand-rest the lathe is equipped with a carriage having rack and pinion feed. This carriage has hand cross-feed and a compound rest so that feeds in all directions may be had.

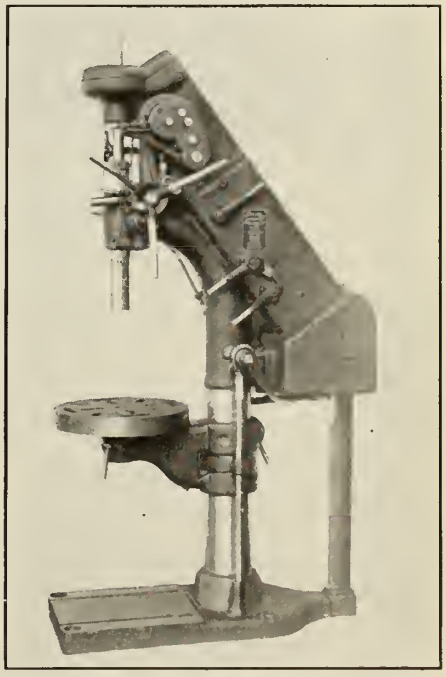
BLOUNT PATTERNMAKERS' LATHE.

The tailstock has screw and lever feed, and is provided with a graduated swivel base so that any degree of taper may be turned or bored; a taper pin is provided to rectify the alignment. The base of the tailstock is provided with a slide, and by means of a ball handle, as shown in front, the tailstock may be fed crossway of the bed, a feature very desirable for boring or turning. A plain countershaft with tight and loose pulleys, or a friction countershaft with two friction pulleys is furnished with the lathe.

SELF-OILED 20-INCH ALL-GEARED DRILL AND TAPPER.

THE All-Geared Drill, of the Barnes Drill Co., Rockford, Illinois, has from its inception been built heavier, stronger and much more powerful than an ordinary drill of same swing, and with the self-oiling system now added it embodies another element that contributes to the highest state of mechanical efficiency. The strength, power and enduring qualities of the self-oiling all-geared drill makes it possible, it is claimed, to attain the maximum speeds and feeds of high speed twist drills.

Every bearing (aside from the spindle sleeve) is self-oiled, while there are eight changes of geared speeds and eight changes of geared feeds, all under instant control of the operator from the front of the machine. Besides there being no cone or inherent belts to buy, to slip, to shift or to maintain. It is positive and a result-producing unit. All gears are fully inclosed, meeting requirements of the modern safety laws.



The drill is furnished with back gears, geared feeds and automatic stop complete, or with geared feeds and automatic stop only. Reversing friction clutch gears and automatic reverse may be supplied when required, while all styles can be furnished with motor drive. For fast high-speed drilling on sizes under 1-in, special crown gearing to double spindle speeds can be furnished. The machine will handle high-speed twist drills from ¼-in. to 1¼-in. at suitable speeds and feeds.

The frame of the drill is unusually heavy and strong, the back brace making it an exceedingly rigid machine. The spindle is made of the best quality of machinery steel, double splined and ground to size, fitted with a special ball thrust bearing of great strength. The spindle is counterbalanced, and the nose is extended to bring drift hole below sleeve. Graduations on sleeve are in inches and millimeters.

The transmission gears are located on the diagonal shafts, and are cut from special chrome nickel steel, bar stock, and tempered, having a tensile strength of 270,000 pounds per square inch. There are eight changes of speeds (four without back gears), any one of which is easily and quicklly obtained without stopping the drill, by simply operating the proper shifting lever, conveniently reached from the front. Proper and convenient means of lubrication are also provided.

The back gears are operated by a small lever accessible from the front of the drill, and may be instantly engaged or disengaged while machine is running. There are eight changes of geared speeds, and any feed may be instantly secured while the spindle is running idle, by placing the small index lever (directly in front of the operator) in the proper notch or segment, feeds being indicated in plain figures.

All bearings, aside from the spindle sleeve and cross spindles, are continuously oiled automatically. Oil is pumped by a geared pump in the reservoir of the machine and distributed constantly to all gears and bearings, including the crown gears and feed box.

20-IN. SELF OILED, ALL-GEARED DRILLING AND TAPPING MACHINE.

This self-oiling system is manufactured under license from Kearney & Trecker Company, owners of U. S. Letters Patent No. 834,063, dated October 23rd, 1906. An automatic stop giving full spindle travel is also furnished, while a safety device prevents overloading and reduces

the breakage of twist drills to a minimum.

A star wheel lever controls the hand feed, and is entirely different from the common ratchet lever. It operated through a pinion running into an internal gear in the ratio of 4 to 1; thus the star wheel handles are equivalent to a common lever of four times their length. This star wheel also acts as a quick return lever, eliminating the use of a ball handle for the purpose. Geared motor drive may be supplied when desired, for which a 2-h.p. motor, speed about 1,200, is recommended.

For tapping, the friction clutch gears give reverse speed of 1¾ to 1, and these gears are on the driving end of the machine—not on the spindle—a strong point.

The machine has automatic reversing mechanism, a very desirable feature, particularly for depth tapping. The trip can be set so that the instant the tap reaches depth desired, the spindle will automatically reverse, backing out at an increased speed. Again, the shifting lever can be set so that when tripped automatically (or by hand), it will return to neutral position, thus stopping the spindle instantly instead of reversing same. The small hand trip lever shown is always ready for instant use if desired to reverse or stop spindle at any point in the operation. Leading features of the specification are as follows:—

Height of drill, 70 ins.; column to centre of table, 10¼ ins.; maximum distance, spindle to table, 26¾ ins.; diameter of table, 16 ins.; vertical travel of spindle, 10 ins.; vertical travel of table, 16 ins.; floor space about 37½ by 16 ins.; weight complete about 750 lbs.

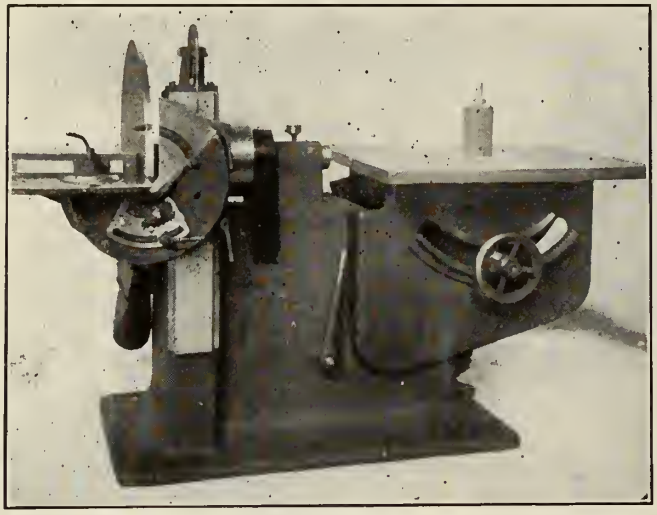


FIG. 1. GARDNER COMBINATION PATTERNMAKERS' MACHINE.

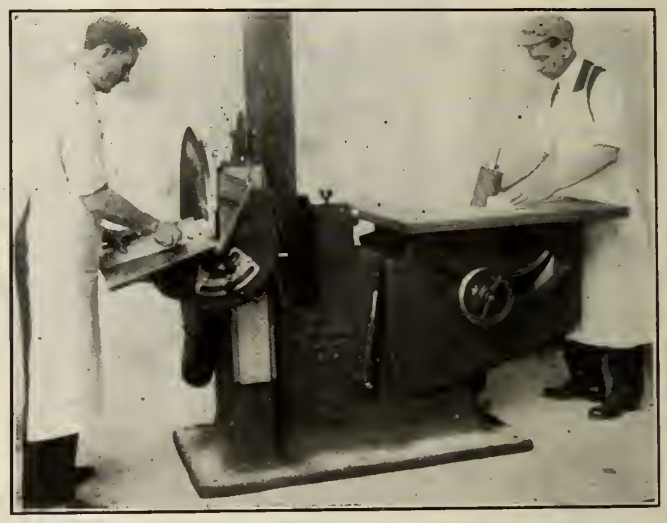

FIG. 2. GARDNER COMBINATION PATTERNMAKERS' MACHINE.

J. H. Plummer, president of the Dominion Steel Corporation, leaves for England shortly.

COMBINATION PATTERNMAKERS' MACHINE.

THE Garduer Machine Co., Beloit, Wis., are introducing a new product known as their No. 20 Combination Patternmakers' Machine, and concerning same the accompanying text and allustrations give prominence to the leading features.

The disk-wheel is 30 inches in diameter and runs at 950 r.p.m. It is faced with a "netbac" garnet disk, which is attached firmly without the use of a wheel press or removing the wheel from the spindle. The universal work table is mounted on a dove-tail slide back of the cutting plane of the disk wheel, and may be raised or lowered and locked instantly at any desired height. Being counterbalanced by a weight within the machine base this operation can be done quickly and without exertion. The table also has angular adjustment to the face of the disk wheel, while a graduated segment at the head of the table accurately shows the angle and one turn of a hand locks the table top in the desired position. The axis of the table is such that its inner edge always remains close to the disk, regardless of the angular position. The importance of this point is most noted when working on small pieces.

There are three work gauges which accompany this table and which are of much practical value. The universal angle gauge is especially efficient in producing compound angles and squaring up pieces, and as its name implies, the duplicating gauge is used in producing duplicate pieces and in generating parallel surfaces. The circle generating gauge makes it practical to do much round work which usually requires a lathe. By its use many external curves can be rapidly and accurately generated. All of these fixtures are convenient, accurate and quick-acting.

The practical uses of the sanding roll have been already proved on the Gardner No. 26 Roll Sander—to generate and finish internal curves. Being roughly cut out on a bandsaw, the piece is finished to proper dimensions on this sanding roll. It does much of the work usually performed by hand carving and on lathes, and in a fraction of the time. The sanding roll is driven by a friction disk, and inasmuch as four different diameter rolls are furnished, all of which are seven inches long, there must be provision for altering the roll spindle. In other words, the 2-in. roll must run at a higher rate of speed than the 6-in. roll. A roll spindle speed variation of from 2,000 to 6,000 r.p.m. is therefore provided.

The rolls are made of cast aluminum and are perfectly balanced. They are faced with a strip of "netbac" garnet which is cut at an angle. This angle makes a spiral seam from end to end of the roll and prevents any "pounding" which would probably result with a straight joint. To remove a worn out "netbac" garnet strip, the roll is simply soaked in cold water for about five minutes, after which the strip can be readily pealed off.

Another feature of importance is that this roll has an up-and-down reciprocating motion of ⅛ in. This action prevents cutting ridges or grooves in the work and also assists in the faster removal of stock. To produce this motion, the roll spindle eugages with a pivoted fork with ball bearing support working over a cam, all of which is positively driven by helical steel gears. The weight of the entire spindle and roll is supported on ball bearings.

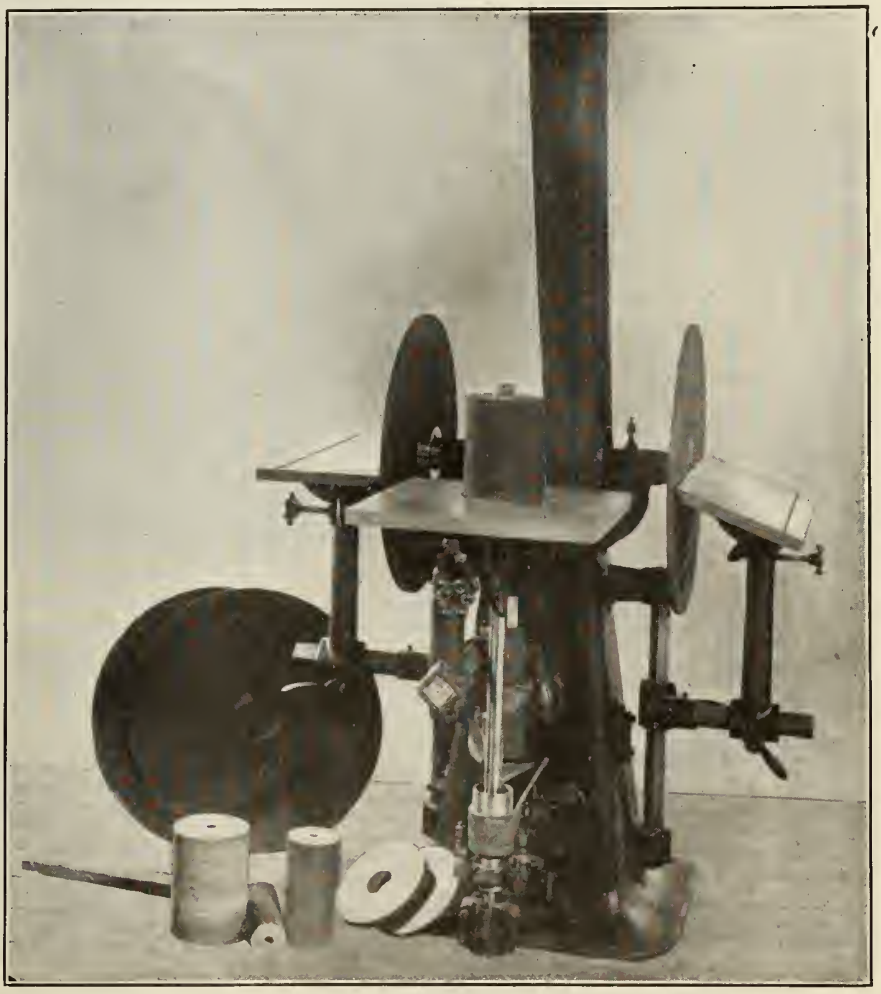
Perhaps one of the most distinctive features of the roll end of this machine is the fact that angles can be finished just as accurately and rapidly as straight surfaces. This is accomplished

by tilting the roll rather than by changing the position of the table top. The table top always remains flat regardless of whatever angle the operator may be working. It is obvious that this is the natural and proper position. The angle at which the roll is tilted is accurately registered on a graduated segment located directly behind the locking handwheel. If the main spindle which carries the disk wheel is in operation, the roll can be started or stopped as occasion requires. The clutch lever controlling the roll, is at the centre of the machine in front, as will be noted in both Fig. 1 and Fig. 2. A hinged door at back of machine base makes the interior of the machine readily accessible.

The disk wheel is always provided with an efficient dust hood, while the sanding roll throws but little dust into the air. Owing to the small diameter of these rolls, the grindings are practically all laid out on the top of the table and can be easily brushed aside. In some classes of work, however, it would be advisable to make provision for dust. This is best taken care of by suspending an exhaust pipe, with enlarged opening, directly above the roll.

The No. 20 machine is made with the main driving spindle in either babbitt lined bearings or in highest grade ball bearings. As shown in the accompanying illustrations, the plain bearings are used. The machine is also well adapted to direct motor drive. If such drive is desired, the motor is mounted on a bracket at the rear of the machine base and connected to the main driving spindle by silent chain. A few of the main specifications of the machine are as follows:—

Disk wheel, 30 inches diameter; disk wheel work table, 36 inches long by 15 inches wide; table for sanding roll, 31½ inches by 36 inches; roll spindle, 1 inch diameter; size of rolls, 2, 3, 4 and 6 inches diameter by 7 inches face; speed variation of roll spindle, 2,000 r.p.m. to 6,000 r.p.m.; speed of machine spindle, 900 r.p.m. The power required to operate the machine at full capacity is 5 h.p., and the operating floor space is approximately 6 feet by 12 feet.



The complete equipment furnished with the new No. 20 combination includes, 30-in. disk wheel, 3 universal work gauges, countershaft, 4 aluminum sanding rolls, a supply of "Netbac" garnet disks and sanding strips, cement, grease, wrenches, etc. The weight of the entire outfit is 3,000 pounds.

THE "DOWNER" GRINDER.

THE Downer Grinder Co., Toronto, Ont., are putting on the market a new wood grinder which is specially designed to meet the requirements of the patternmaker and woodworker. The machine, it is claimed, is very flexible as regards the variety of work that can be done, at the same time effecting a great saving of time and labor. Any regular or irregular shape work can be readily ground to exact dimensions and form, dispensing in many cases with the necessity of using a band saw.

As will be seen from the accompanying illustration, the grinder has two horizontal disks and a vertical drum. The disks are made of steel, 24 in. diameter, each having two abrasive surfaces, while the vertical spindle will take drums from 1½ in. to 7 in. diameter. The drums can be removed from the vertical spindle and attached to the main arbor, thus forming a horizontal drum.

This attachment, in conjunction with the adjustable table, performs the same service as a planer. All the tables are adjustable and can be tilted to any desired angle; they can be lowered to the extreme edge of disk or removed, leaving the disk entirely exposed when handling large pieces of wood.

THE DOWNER WOODWORKERS' GRINDER.

The grinder illustrated occupies a floor space of 42 x 48 in. and weighs 1,200 lbs. Patents are, we understand, being applied for in Canada, Great Britain, and the United States.

Steam Boilers in Central Stations.—In a paper on "Steam Boiler Operation in Central Stations," Mr. J. W. Jackson says:—"The selection of fire-bricks is one that naturally requires very careful attention. The particular make of fire-brick to be used depends not altogether upon the quality of the brick, but to a great extent upon its character. Some fire-bricks with great reputations run to slag very quickly indeed, while, again, other fire-bricks practically unknown do excellent work with the same coal. There is, of course, no great wonder at this when it is remembered that the sulphur content of coal varies very considerably, while, again, some coals contain a fairly considerable amount of impurity, such as fire-clay. This fluxes some makes of bricks very badly, and, on examining the furnace after quite a short run, it will be found that the molten fire-brick or slag has run down the underside of the furnace arch, cutting quite deeply into the fire-brick and practically making rivers running down the side walls and on to the grates, with the result that the fires quickly get into a very bad condition, and need to be cleaned by means of a long slice as frequently as once per hour."

THE BUSINESS OUTLOOK.

IT is quite evident that no concerted attempt to bring business conditions back to normal will be made until this year's crop is assured as to quantity and quality. It is impossible to shut one's eyes to the fact that control of our financial resources is the monopoly of a few, so that when they say "thumbs up," we all follow, and do likewise when it is "thumbs down."

The period of adjustment, so aptly termed and so much and so brazenly paraded is nothing short of a reflection on the capacity of those who dictate our financial affairs, in that they allow things to run riot sufficiently long to make it worth while, and then turn about to the other extreme and play that as long as it yields a return. There are devious ways of working for the upbuilding of Canada industrially, but those most in evidence are simply appendages to personal profit.

THE PLACING OF RESPONSIBILITY.

THE success of a great many notable business men, as one notable himself has said, is due to their ability to secure the highest possible quality of service from others. John Wanamaker accomplished this by seeking and securing the highest type of help from other successful institutions. R. T. Crane, on the other hand, did just as well by devoting particular attention to the training of his own men.

In any case, the ability to specifically place the responsibility for the perfection or non-perfection of a piece of work upon some particular man rather than upon onself is a most important step towards the desired end. While the application of this principle in the stern, Napoleonic fashion of some of our industrial barons is not to be advocated, yet the man with many jobs to look after and numbers of men to keep busy and contented will find it a great worry absorber.

Again, it will also declare when the foreman himself is at fault and enable him to place before his subordinates an occasional example of chivalrous acknowledgment. The accurate placing of cause before an error occurs requires but to call the man's attention to the results afterwards, avoiding the intermediate steps of questioning, accusing and argument and assisting greatly the establishment of harmony and good-will.

VERSATILITY IN MANUFACTURING METHODS.

WHEREVER we go we find narrowness of thought and cramped facilities the cause of much friction and trouble. The foreman alone knows what it is to be beset by the inaptitude of green hands on the one hand and the lack of broad-mindedness of very old employees on the other.

One of the most difficult things the conscientious man in charge must face is the forcing of corrective measures involving personal conduct and work. The natural desire to avoid the wrong-doing man in the hope that he will either kill or cure himself is responsible for much vexation that the well-meaning foreman does not deserve. The sooner and more fearlessly an act of wilful insubordination or disrespect can be tactfully corrected the better for all concerned. If the act can be prevented or nipped in the bud the results will be better still.

By far the most effective means of reducing trouble of this kind is to train a number of men and to provide several different methods for doing every job in the plant. The most unreasonable man is he who is encouraged to believe himself the only man that can do a certain piece of work. The competition of several men on the same work will promote a useful rivalry and a mutual regard and respect. The preparedness to do a job either on the shaper or grinder or on the lathe or drill press will wonderfully facilitate the regulation of men and quantities as well as the determination of the best methods of doing things.

An adoption of both these maxims as working principles, coupled with tact and fearlessness, will do much to eliminate worry and discourage antagonism as well as to encourage a healthy rivalry and general good-will.

INDUSTRIAL NOTABILITIES--No. 36

HON. SIR LYMAN MELVIN JONES was born in County York, Ont., September 21, 1843, son of Norman and Therese Jane (Patterson) Jones.

As a young man he entered the employ of A. Harris & Co., agricultural implement manufacturers, Brantford, Ont., and was admitted a partner of the firm in 1878, becoming Western manager with headquarters at Winnipeg in 1879, and later being made general manager of the company.

Sir Lyman has taken an active part in municipal, political, and business affairs, hence we find him Alderman and Chairman Finance Committee, Winnipeg in 1886; Mayor of Winnipeg during 1887-1888; Vice-President Board of Trade, Winnipeg, 1887-1888; Member Manitoba Legislature, 1888-1889; and Provincial Treasurer, Greenaway Administration during the same period.

HON. SIR LYMAN MELVIN JONES.

On the formation of the Massey-Harris Co., he was appointed general manager of the consolidated companies, and in 1891 he moved to Toronto. Since 1902 he has been president and general manager.

In 1901, Sir Lyman was called to the Senate of Canada, while the honor of knighthood was conferred on him in 1911.

He has been a member of the Toronto Board of Trade since 1893, is a member of the Toronto, National, Royal Canadian Yacht, Victoria, Toronto Cricket, Ontario Jockey, and Rideau (Ottawa) Clubs, and is rated a millionaire.

He married Louise Irwin, daughter of Thomas Irwin, Tecumseh, Ont., in July, 1872, and there is one daughter.

Sir Lyman is a Director, the Canadian Bank of Commerce; Director, The Verity Plow Co., Brantford, Ont.; Director, Blackstone Mutual Fire Insurance Co.; and Merchants Mutual Fire Insurance Co., Providence, R.I.; President, Bain Wagon Co., Woodstock, Ont.; and President, Johnston Harvester Co., Batavia, N.Y.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., May 23, 1914.—This week has brought very little change in local conditions, although some firms report a slight improvement in machinery inquiries. The C.P.R. have placed a few small orders for single machines during the past week, but apart from this there is nothing special to report.

A dispatch to hand contains the information that the committee of first and second bondholders of the Canada Iron Corporation have now completed the scheme of the proposed reconstruction, which will be submitted at a meeting to be held in London on July 2. The new company, which it is proposed to form, will create £200,000 of six per cent. debenture stock, of which not less than £120,000 nor more than £140,000 will be subscribed at 95 per cent. to provide the necessary cash for a working capital. The remainder will be held in reserve. There will also be created £800,000 of six per cent. debenture stock. The existing first bondholders will be allotted an amount equivalent to the par value of their existing bonds. Non-cumulative six per cent. preference shares and common shares will also be created.

Navigation on the St. Lawrence has been greatly delayed during the past week by the thick haze of smoke, resulting from the numerous bush fires. The financial loss has been considerable, many vessels being as much as ten hours overdue. The Hall Engineering Works are busy effecting repairs to the Manchester Inventor, which suffered damage to her bow and broke off two blades of her propeller in the heavy ice encountered in the Gulf. The repairs necessitate a considerable amount of work, as she was leaking rather badly; but it is hoped to have the ship ready to sail again on her schedule date.

The building trade is fairly active, and a commencement has been made with a new ten-story office building to be erected by the Bank of Toronto. A large number of residential houses are also planned for this summer, and in most cases work is well under way. The Good Roads Congress closes to-night, and has been a pronounced success, large numbers having visited the Arena from day to day.

The steel market shows no improvement. Inquiries are light, the locomotive and car works still working with much reduced staffs, and with little prospect for any immediate improvement.

Metals.

The tone of the metal market is perhaps slightly improved, and a few inquiries are now being received. Casting copper is up ¼ cent. per pound, lake and electrolytic remaining firm at their former prices. Tin continues to fall. A further decrease of 1 cent per pound has been recorded this week. The demand for pig iron continues very dull, though in view of the small stocks which the consumers have on hand, it would seem probable that the demand must improve in the immediate future. Most foundries have now on hand not more than would last them normally about two weeks, but even so, they seem reluctant to commit themselves to any large contract, and continue to buy in a hand-to-mouth manner. At present prices furnaces are not making any money, and it is understood that the only Canadian furnace now in blast is about to close down for a short period until prices improve.

Toronto, Ont., May 26, 1914.—Trade conditions do not show any material improvement this week. A want of confidence still seems to prevail in business circles. It looks as if this period of depression will continue for some time. The outlook is perhaps not as bad as present conditions would indicate, although as the season advances it becomes more evident that there will not be much improvement industrially, at any rate, until a good crop is assured. The crop reports are favorable, generally speaking, and conditions in this respect are normal. It is to be hoped that the crop returns will be such that they will, in a large part, make up for the falling off in manufacturing and so place the country in a favorable position for next year. In the meantime a quiet period must be expected which will in some respects be beneficial, if only to serve as a check to speculative enterprises.

It is probable that the transportation facilities may be considerably improved in the suburban districts of Toronto. It has been suggested that the city should operate a service of motor buses in certain districts not actually served by the street railway. The Board of Control will ask for an opinion as to the legality of a by-law being submitted to the ratepayers for the raising of $250,000 for the purpose of buying the necessary equipment.

In a general way iron and steel market conditions show no material change over last week, although there appears to be a feeling that business in these products will improve at no distant date. Prices are being maintained and it is probable that the bottom has been reached. The demand for structural material is quiet, specifications being light. It is reported that a scheme for the proposed reconstruction of the Canada Iron Corporation will be submitted to the bondholders at a meeting to be held early in July. A satisfactory solution to this company's difficulties will be welcomed generally.

The pig iron market is dull and the demand has not improved, consumers only buying to cover immediate requirements. Additional tonnages of Nova

Scotia iron have been delivered at Bridgeport, Conn., and Philadelphia, Pa., on contracts closed with the Dominion Steel Corporation.

Machine tool dealers report little business, and that only in single machines, no good-sized specifications have been received for some time. A number of enquiries are apparently being held up pending a return of better trade conditions. In machine shop supplies a steady business is being done, although consumers are still sending in light orders.

The metal markets are quiet and in much the same condition as last week. Prices keep about the same level, although the market is dull and there is little business passing.

St. John, N.B. May 23, 1914.—Work is being rushed on the Valley Railroad from the Barony to Andover, N.B., by the contractors, Kennedy & McDonald, who have about 900 men employed. A new steam shovel has recently been added to their equipment at a cost of $13,000, and three trains are at present hauling away material from it.

This week it is planned to start work on the section from Woodstock to the Barony, in ballasting. Two shovel outfits will be used. By August 30, this work will be completed, it is expected.

The Dominion Bridge Co. will finish work soon on the superstructure for the new bridge at Pokiok, N.B. On the comperature was below zero, and even as low & McDonald will resume track laying from that place to the Barony, where they will tie up with the Hibbard Co., and the whole line to Fredericton will be completed and ready for the Intercolonial Railway operation by August 30.

The line from Woodstock to Centreville, N.B., is about finished, and freight trains are now running over this branch road. The Dominion Government this week announced its intention of erecting three new bridges for the lower part of the new Valley Railway at a cost of about $3,000,000, and it is hoped to have a start made on the work this summer. This new road will have a remarkable influence upon the industrial life of New Brunswick and will open up a great stretch of undeveloped territory besides offering railway facilities to many inland towns.

Plans have been drawn for a new agricultural building at Sussex, N.B., at a cost of $40,000. A new railway depot is also being erected at that place, and there are signs of much building and industrial activity during the present year.

—⚙—

No successful method has yet been found for depositing silver in any solution which does not contain cyanide.

Miscellaneous

Engineers' Adjustable Wrench.—The Billings & Spencer Co., Hartford, Conn., have brought out an engineers' adjustable wrench, which is capable of being used wherever there is need for a solid end wrench, and in addition possesses the advantage of being adjustable for various sizes of nuts. The motion of the movable jaw is controlled by a worm meshing with a rack formed in the back of the jaw. The wrench is drop forged throughout and is made in four sizes, for handling 5/8, 15-16, 1 1/8 and 1 5-16-in nuts. The length of the smallest wrench is 6 in. and the largest 12 in.

Electric Motor Operation and Maintenance.—In a paper by Mr. E. F. Butler on "The Operation and Maintenance of Electric Motors," recently read before the Junior Institution of Engineers, the author pointed out that to get the best results the upkeep of the plant should be considered before it was installed, and the points to which special attention should be paid were suitability to the requirements, accessibility, the use of the smallest possible number of different sizes of motors, and standardization in every possible way, so that the number of spare parts and replacements which had to be kept in stock might be reduced to the utmost. With regard to the choice of motors and their control gear, the author enumerated the constructional features which should be found in a good machine, and gave a series of practical hints for remedying faults in existing installations.

Cedars Rapids Mfg. and Power Co.—The substantial progress accomplished in the ten-million-dollar water-power development at Cedars Rapids, near Montreal, was revealed to an interested party which made a visit of inspection to the new plant on Saturday, May 16, as guests of the directors of the Cedars Rapids Manufacturing and Power Co. In respect both to speed of construction and to cost, the undertaking gives fair promise to prove a record-breaker among local enterprises of like magnitude by justifying the advance estimates of the company. In important directions the work is now three-quarters completed, the company being well within the carefully-drawn-up schedule, which was mapped out some two years ago. Barring some unforeseen and very improbable setback through the summer, the plant will be developing by November 1, the 100,000-horse-power planned as the initial installation.

Combating Interference with Construction Work.—By keeping currents of several hundred amperes flowing continuously through water pipes which otherwise would have been in danger of freezing, it was possible to continue construction work on the hydro-electric development of the Cedar Rapids Co., near Montreal, without interruption during even the coldest days of the past winter. The 1-in. pipes thus protected supplied water for the steam shovels and were laid above ground, as continuous shifting prevented them from being buried. Current for the pipe circuits was obtained from a bank of transformers stepping down from 2300 to 220 and 110 volts. The pipe connections consisted of copper wires wound around the ends of the pipes and buried several feet in the earth to prevent the pipes from freezing below the connection. When the templetion of this bridge at Pokiok, Kennedy as —27 deg. Fah., it was found that 40 kilowatts at 220 volts would keep 1,500 ft. of 1-in. pipe from freezing, even with water standing in it. A 1,000-ft. pipe required 20 kilowatts at 110 volts.

—⚙—

NOT EFFICIENT IN ALL DEPARTMENTS.

THE Ford Motor Co., which has so efficient an organization, is doing a lot of unnecessary work in connection with its outgoing letters. The Ford outgoing mail is unusually large and a great deal of time, labor and money is being saved through the use of a No. 6 outlook envelope, but the name and address upon the envelope, for some reason, are placed in a position that makes it necessary for the mail clerks to go through five operations to fold and insert the letterhead, and the four folds upon the letter does not give their correspondence a very neat appearance when removed from an envelope.

A great many concerns who take pride in the appearance of their correspondence are adopting the No. 9 envelope in preference to the No. 6, not alone for the purpose of saving time in the putting up of the mail, but on account of the appearance of their correspondence when it reaches their customers, as there are but two motions in folding a letterhead for a No. 9 envelope, against four motions for the No. 6 or 6 1/2, or five motions for the smaller size envelope when the address is not placed in the correct position.

The Ford Company is apparently no different from the majority of concerns, who have been making thorough studies as they apply to the manufacturer, but they have not carried the same studies into the administrative end of the business. With the splendid work that is being done at the Ford plant, it will only be a question of a short time before the discovery will be made that they are doing double the work necessary in putting up their daily mail.—Efficiency Magazine.

TRADE AND COMMERCE RECORD

Dealing With the Steps Being Taken and Progress Made by Industrial Canada To Achieve and Maintain a Dominant Place in the Markets of the World

RETRENCHMENT AND ECONOMY.

IN a recent interview regarding immediate business prospects, Sir Frederick Williams Taylor, manager of the Bank of Montreal, said the Canadian people must learn the lesson of retrenchment and economy.

"Extravagance has been rampant in Canada for the last few years," he declared. "Business men have accepted our amazing prosperity as fact and have not thought it worth while to consider whence it came. They have accepted all these good things as though they were rained down from heaven above, but it is time to realize that our recent industrial and business expansion has been brought about by an inflow of British capital. That fructifying stream has been the main cause of our tremendous development in recent years, and Canada should consider whether it is not wise to take measures to prevent that stream from drying up.

Temporary Prosperity.

"Mere lavish expenditure of capital will bring temporary prosperity even if that capital is flung about in the Sahara desert; but such prosperity is without any element of enduring success. True prosperity must be built upon the sure foundation of hard work and productive enterprise. Gambling and speculating in real estate and other attractive ventures must inevitably bring reaction and depression.

"It is almost incredible, and yet a fact, that the cost of living in Canada is the highest in the world, and yet we have millions of acres of virgin soil, hundreds of millions of wealth in natural resources, and a virile, vigorous and aggressive population.

Elements of Success.

"Canada has all the elements necessary to command success. She has people, resources, enterprise and access to sources of capital. Let it not be forgotten that our prosperity depends upon a proper use of these materials, and further than that, let it not be overlooked that the stream of vitalizing capital from England is essential to our growth and industrial and financial progress.

"Canadians should set their faces against wildcat propositions, and seriously consider whence their prosperity has come and how it can be furthered and preserved."

CANADIAN ALLIS-CHALMERS, LTD., STRATFORD PLANT.

THE Stratford Mill Building Co., Ltd., Stratford, Ont., was taken over last September by the Canadian Allis-Chalmers, Ltd., of Toronto. The new proprietors at once proceeded to make considerable extensions, including a large addition to the main building and the erection of a dry kiln, etc. The plant will be equipped with modern machinery for making a full line of transmission, elevator and flour mill machinery.

The site consists of about seven acres on the corner of Erie and Gore Streets, on the main line of the Grand Trunk R. R. in the city of Stratford. A switch from the main line runs into the yards, giving good facilities for receiving and shipping freight. The main building is in the form of an L, three stories high, 320 feet long by 50 feet wide. The corner on each floor is used for offices. The superintendent's office is on the ground floor, the main business offices on the second floor, and the draughting office on the third floor.

The main floor is occupied by the machine and erecting shops, and iron-working departments, while on the second and third floors are the wood-working, pattern and tinsmith departments, storerooms, etc. A freight elevator connects the various floors, which are heated by steam, by the Webster vacuum system, and are artificially lighted by electricity. The large windows give an abundance of natural light, and the shops are equipped with every modern convenience, the men thus working under the very best possible conditions.

On the east side of the plant, adjoining the main building, to form another L, is a wing 250 feet long by 50 feet wide, in which are located the steam plant, blacksmith shop, foundry and planing mill. South of the main building on the west side is the shipping de-

STRATFORD, ONT., PLANT OF CANADIAN ALLIS-CHALMERS, LTD.

partment, and south of this again are the lumber sheds. In the centre of the group of buildings are the dry kiln, pattern storage and general storage sheds.

Canadian Allis-Chalmers, Limited, have secured from the Allis-Chalmers Mfg. Co., of Milwaukee, Wis., the exclusive right for the Dominion of Canada to sell and manufacture the entire line of Allis-Chalmers flour mill machinery, elevator equipment, transmission and other machines manufactured by that company, and the entire line will be built in the Stratford shops from Allis drawings and patterns.

LAND UNDER CULTIVATION IN CANADA.

THE potential agricultural resources of Canada are indicated by the fact that not more than 2.6 per cent. of the total land area of the nine provinces is now under cultivation. This is one of the interesting statements in a bulletin just issued by the Census and Statistics Branch of the Department of Trade and Commerce.

The total land area of the nine provinces is placed at 1,401,316,413 acres. The area of farm land occupied in 1911, according to the census figures, was 109,777,085 acres, or 7.18 per cent. of the total. It is estimated that within the boundaries of the nine provinces as at present constituted, there is a total cultivable area of 440,951,000 acres. This, it will be noted, is only 31 per cent. of the total land area, and takes no account of forest and swamp lands which may ultimately be tilled, nor of northern areas, of which the agricultural possibilities are at present unknown, because unexplored and unsurveyed.

The total area under cultivation is given as 36,000,000 acres, of which field crops represent 35,375,000 acres, and fruit and vegetable crops 625,000 acres. Only about 33 per cent. of the area now occupied as farm land is at present under cultivation, while, as noted above, only 2.6 per cent. of the total land area is utilized for agricultural purposes.

In Prince Edward Island, 86.01 per cent. of the total land area is occupied as farm land, while 90 per cent. is estimated as being possible of cultivation.

In Nova Scotia, 38.83 per cent. is occupied as farm land, with 60 per cent. of the total land area possible of cultivation.

In New Brunswick, 25.36 per cent. of the land area is occupied, with 60 per cent. cultivable.

In Quebec, 3.52 per cent. is occupied, with 10 per cent. cultivable.

In Ontario, 9.37 per cent. is occupied, with 25 per cent. cultivable.

In Manitoba, 8.33 per cent. is occupied, with 50 per cent. cultivable.

In Saskatchewan, 18.39 per cent. is occupied, with 60 per cent. cultivable.

In Alberta, 10.96 per cent. is occupied, with 65 per cent. cultivable.

In British Columbia, only 1.12 per cent. is occupied, with 20 per cent. cultivable.

TRADE WITH GREAT BRITAIN.

THE following are the official trade figures between Great Britain and Canada in the undermentioned articles during April:—

From Canada.	1914.	1913.
Wheat	£388,132	£348,066
Wheatmeal and flour.	146,847	203,079
Barley	19,965	50,944
Oats	4,418	7,498
Bacon	71,225	68,583
Hams	14,666	25,446
Cheese	6,872	53,731
Canned salmon	132,510	98,926
To Canada.	**1914.**	**1913.**
Spirits	75,626	89,676
Wool	12,464	9,700
Pig iron	4,483	7,105
Wrought bars	3,152	9,121
New rails	845	1,871
Galvanized sheets	55,361	70,657
Tinned plates	6,796	11,804
Steel bars, etc.	16,247	47,959
Pig lead	5214	12,499

HYDRO PLANS BIG PROVINCIAL DEPOT.

AFTER investigating some fifty different sites, the Hydro-electric Power Commission have purchased a lot on the west side of University Avenue, Toronto, for the new central hydro offices. The deal involves an investment of $65,000 in the property, which is situated near the corner of University Avenue and Orde street, and has a frontage of 100 feet on the Avenue and a depth of 145 feet.

For about two years the question of a central hydro building has been on the tapis, and the selection of the property will clear the way for the Commission to go ahead with its plans. There is a provision of $100,000 in this year's estimates for the building, but the completed structure will probably cost in the neighborhood of $300,000.

The idea of the Commission is to establish extensive laboratories and testing shops, and carry on a central purchasing bureau, with the view of buying supplies in large quantities and turn them over to the municipalities at cost. The testing of new equipment will be another important branch, as well as designing new equipment as the need arises.

There is a proposal to make this building part of the hydro ssytem, and levy an assessment on all the municipalities for its construction and maintenance.

BRITISH TRADE IN CANADA.

THE Canadian Trade Commissioner, C. Hamilton Wickes, addressed the London Chamber of Commerce on May 19, his subject being "British Trade in Canada." Mr. Wickes gave an important analysis of the present position, and showed that of the British trade with the Dominion, valued at 136 millions, the amount on which preference was given amounted to 93 millions. Of 76 millions of competitive trade, 63.5 per cent. was given preference. Were Great Britain to compete on level terms with the manufacturers of other countries she could secure only 14.7 per cent. of the trade.

He had come to the conclusion that if Canada had not granted British trade preference that trade would have been practically nil. Of this 14.7 per cent. a great deal consisted of specialties, such as whiskey and beer, in which commodities there was practically no competition. If the specialties were eliminated, and they were to compete on level terms, they would hardly get any trade at all. The United Kingdom's share of competitive trade was 33½ per cent. It was not a bad proportion, but it was nothing like what it should be, having regard to the excellence of the manufactures and goods which British trades could supply.

The lecturer urged the representation of British firms by agents in the Dominion, adding that until the trading community took a practical interest in trade commissioners, the organization which the Board of Trade had provided would never be as useful as it ought to be.

U. S. Steel Conditions.—Steel market conditions have shown but small change, and while there is still talk of the expected improvement in demand in the near future, nothing of this has been witnessed yet. The railroads are starting their inquiries for new equipment where it will be needed to move the crops, but unless there is a decided improvement in other lines of activity, even the huge crops will not necessitate much additional purchase of cars and locomotives because of the unprecedented total of idle cars. The prospects for unfilled tonnages this month are about the same as last, with a large decrease in view unless buying picks up materially. The rate of steel production for the whole country is placed at around 60 per cent. of full capacity.

The Ford-Smith Machine Company

The Flat Surface Producer

Whether your proposition is a manufacturing one or a varied line in small quantities, you should consider carefully the many advantages of Disc Grinding.

A few of these are: accurate work in a fraction of the time required for milling or shaping, skilled help unnecessary, and the elimination of time of chucking.

We are building a quality line of Disc Grinders, heavy bodies, adjustable Phosphor Bronze Bearings, and plenty of belt power. The tables are made in several styles to suit different classes of work.

It will pay you to look carefully over your methods of productions with Disc Grinding in view, and get **our catalogue at once.**

These Asbestos Lubricants

Kill Heat and Friction and Eliminate to the greatest extent all Ball-Bearing Troubles

ASBESTOLENE

A lubricant that is manufactured specially to meet the growing demand for a high-grade friction-eliminating substance, one that prevents heat due to friction, and reduces that friction itself to the minimum.

SPEDOLENE

Designed especially for use in connection with Transmissions, Differentials, Universal Joints, Bearings, and all worn gears in Motor Cars or Trucks. Where rapidly moving parts are to be satisfactorily lubricated, this cannot be equalled.

AXOLENE

Is the most economical grease. Where there is a demand for a heavier-bodied lubricant, this meets the requirements perfectly. It does not become hardened with age, it is not affected by atmospheric changes. It meets with general favor as a lubricant where slower speeds are to be encountered.

Their use means a saving of much money. Let us tell you how.

Want to write users? We'll gladly furnish you with names.

ASSOCIATION AND PERSONAL

A Weekly Record of Current Association News and of Individuals Who Have Been More or Less Prominent in Machinery Circles

Personal

A. C. Morris, secretary-treasurer of the Ontario Wind Engine & Pump Co., Toronto, Ont., died on May 20, at the age of fifty.

John Bain, of James Bain & Son, machinery manufacturers, Hamilton, Ont., died at the age of 41, on May 13, after a long illness.

A. W. Smithers, chairman of the Grand Trunk Board, has arrived in Canada on a visit in connection with the affairs of the railway.

J. B. Tyrrell, mining engineer, of Toronto, has left for British Columbia, where he will examine and report on several mining properties.

Walter Lyon has been appointed the Montreal representative of the Standard Ideal Co., Ltd., Port Hope, Ont. Prior to this Mr. Lyon was with the Standard Sanitary Co., Toronto.

George Hadrill, secretary, and John Quintal, vice-president of the Montreal Board of Trade, sailed last Thursday on the Calgarian, to attend the International Congress of Boards of Trade, at Paris.

R. F. Armstrong has returned to Camrose, Alta., from Montreal, to join the engineering firm of Maxwell & Mackenzie. Mr. Armstrong will be busy for a good part of the summer on the installation of an electric light plant and waterworks system at Coronation.

A. Atherton, vice-president of the Herbert Morris Crane & Hoist Co., Ltd., Toronto, is visiting Canada in connection with the business of the company. Mr. Atherton, whose headquarters are in Loughboro', England, is chief engineer of the parent company, and president of the branch in Paris, France. Mr. Atherton will be in this country about six weeks.

A. M. Nanton, of the Winnipeg financial firm of Osler, Hammond & Nanton, was elected a director of the C.P.R. at the regular monthly meeting of the board held on May 11. Mr. Nanton succeeds the late Sir William Whyte, and in view of his steadily growing prominence as a leader in the financial and commercial life of the West, the choice will be regarded as an excellent one. Mr. Nanton, still a comparatively young man of 54 years, has been closely associated with the wonderful development which has taken place in the Canadian West, and while lacking the experience of practical railroading which Sir William Whyte possessed in so high a degree, he has been steadily coming to the front for a number of years in parallel lines of endeavor. At the moment probably no one else stands out so prominently as a leader in the business life of the Prairie Provinces. When the Ogilvie Flour Mills some nine months ago were searching about for a suitable representative of their large western interests,

WHO'S WHO.

F. G. BRENTON.
Canadian Manager, Schuchardt & Schutte.

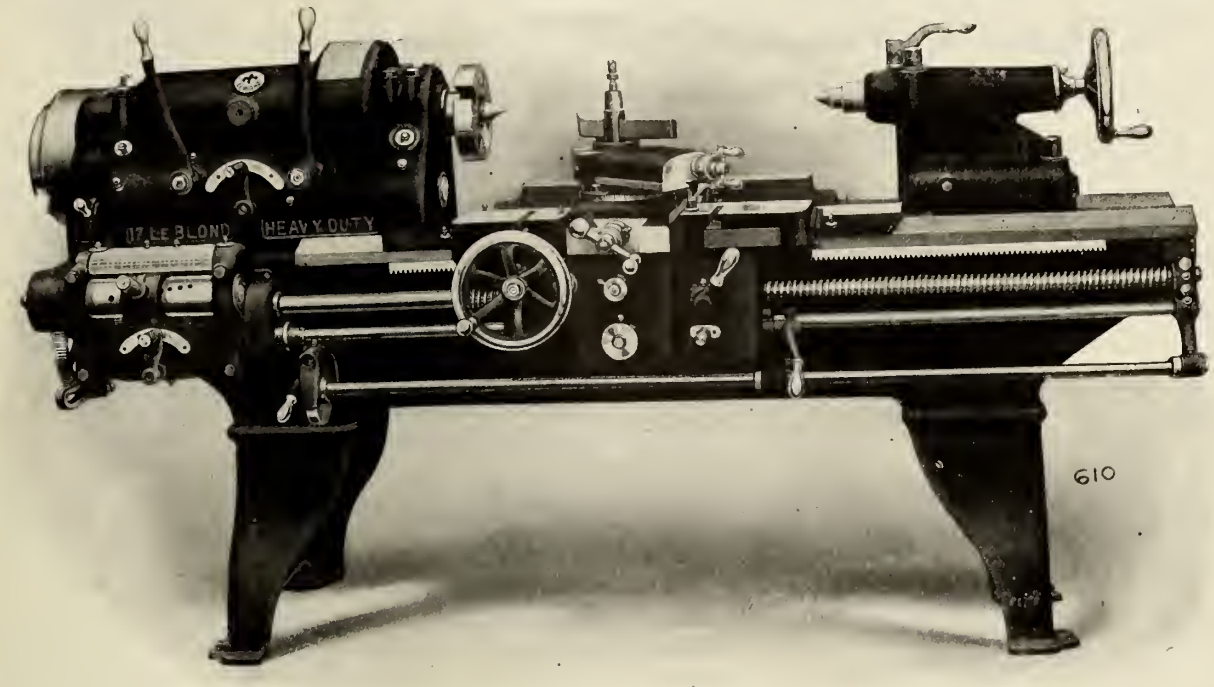
Mr. Nanton was the man on whom the choice as a new director naturally fell. He has been president of the Winnipeg Stock Exchange, president of the Winnipeg Board of Trade, represented Western interests on the boards of the Dominion Bank, the Cockshutt Plow Company, and the Toronto General Trusts Corporation. Among other large enterprises of western origin with which he is connected as a director are the Winnipeg Electric Railway, the Great West Life Assurance Company, and the Manitoba Bridge and Iron Works, Ltd.

If you don't want people to like you, criticize what they do.

Trade Gossip

Heap and Partners (Canada), Ltd., have moved from the Dominion Express building to larger offices at 24 Victoria Square, Montreal.

The Monarch Refillable Fuse Co., 32 Main E. Street, Hamilton, Ont., have purchased the Canadian rights of a patent refillable fuse which they will make at a new factory which is being equipped in Hamilton. Mr. S. Coons is the manager.



The Cataract Refining Co., 501 Traders Bank Bldg., Toronto, Ont., have taken over the business of the Peterson-National Core Oil Co., and will manufacture all the different grades of liquid core compounds that have been heretofore made by that company.

Exports of Flour.— Some Canadian milling companies, report an increase in their exports of flour to England and elsewhere, but it is pointed out that the export business is the least profitable end of the milling indnstry. It is understood that the domestic requirements are not so great as a year ago.

The St. Thomas Electric Co., Ltd., St. Thomas, Ont., operating up to the present time as Youmans & Whitworth, have received their charter. The following officers have been elected: W. K. Cameron, president; J. T. Webster, vice-president; F. A. Youmans, sec.-treas. Directors: W. K. Cameron, J. T. Webster, F. A. Youmans, B. W. Whitworth, B. W. Youmans.

Thos. Firth & Sons., Ltd., of Sheffield, England, have opened a warehouse at 79 Adelaide street W., Toronto, for the sale of their tool steels. We understand that it is the intention of the company to carry a large and complete stock of their well-known brands, such as "Speedicut" high speed, "Extra" and "Best" carbon tool steels and mining drill steel. Thos. Firth & Sons, Ltd., opened a warehouse in Montreal a few years ago, and the business developed so rapidly that it was found necessary to improve the facilities for supplying the trade in Western Ontario. The Canadian business of the company is in charge of Mr. J. A. Sherwood, assisted in Toronto by Mr. John J. Coleman, who has for several years been connected with the Chicago and Cleveland branches of the Firth Sterling Co.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Oxbow, Sask.—The municipality is considering the question of installing an electric lighting plant.

Smith's Falls, Ont.—The Percival Plow & Stove Works, Merrickville, will probably build a plant here.

Kerrobert, Sask.—It is reported that the Grandview Ironworks Co. will locate here. Mr. R. Boardman is manager.

Sherbrooke, Que.—Machine shop plans for the Sherbrooke Machinery Co. are being prepared by H. G. James, architect, of this city.

Gananoque, Ont. — The Gananoque Electric Light Co. has awarded to Mitchell & Wilson the contract for additions to its power plant.

Leduc, Alta.—The town will install an electric lighting system at a cost of $15,000. Engines, boilers and electric equipment will be required.

Essex, Ont.—The town council contemplates installing a dynamo, motor and pump and laying mains to connect Garrow well with the town system.

Assiniboia, Sask.—The town council are considering the installation of an electric lighting plant. Murphy & Underwood, Saskatoon, are the engineers.

Carlyle, Sask.—Construction on the large municipal electric lighting system has commenced. The Smith Electric Co. of Melville, have the work of installation in hand.

Walkerton, Ont.—Mr. Seraphine Ellinghausen of Hanover has purchased the Walkerton foundry from his brother Isador, who has owned and conducted it since it was erected.

Smith's Falls, Ont.—It is reported that a firm of New York brokers are negotiating with the council with a view to establishing a motor car factory here, if satisfactory terms can be arranged.

New Glasgow, N.S.—It is stated that the A. McPherson Co., Ltd., of this city are contemplating the removal of their foundry to Antigonish. A new company will be formed with a capital of $20,000.

Pembroke, Ont.—The ratepayers carried a by-law on May 19, by a large majority, granting the Electric Manufacturing Co., of Canada, Ltd., a bonus of $5,000, a loan of $50,000, and a fixed assessment of $25,000.

Brigden, Ont.—It is probable that an automatic electric lighting system will be installed here. Proposals have been submitted by the Northern Electric Co., and the R. A. Lister Co., of Toronto. Natural gas at 30 cents is being used at present.

Brantford, Ont. — The Brantford Scale Co. have decided to increase the capital stock to $150,000 and to erect a new factory. Property has been secured on Grey St., and a two-storey building will be erected, 50 by 130 feet. Mr. Howard is the manager.

Hamilton, Ont.—H. M. Marsh, publicity commissioner, has opened negotiations with the A. & P. Stevens Elevator Co. of Glasgow, Scotland, with the object of inducing that concern to locate here. It has now decided to build a plant, the first unit of which will cost $250,000. Sites in East Hamilton and the city of Toronto are under consideration, and a decision is expected shortly.

Municipal

Weston, Ont.—The town council are considering the question of establishing a municipal abattoir.

Port Alberni, B.C.—The town council has instructed an engineer to prepare plans for a sewer system.

Port Alberni, B.C.—A by-law to authorize the raising of a loan of $5,000 for a steel bridge, will be voted on by the ratepayers.

Kelowna, B.C.—A by-law was voted on by the ratepayers on May 27 to authorize the raising of $2,000 for fire fighting apparatus.

Victoria, B.C.—The town council propose spending $3,500 on road machinery. A by-law will be voted on by the ratepayers on May 27.

Iroquois, Ont. — The village propose leasing the electric light plant and waterworks to Mr. M. F. Beach for a period of ten years.

Wolseley, Sask.—A by-law will be voted on by the ratepayers on May 29 to authorize the sale of debentures for $3,500 to install an electric light plant.

Wallaceburg, Ont.—A by-law will be voted on by the ratepayers on May 26, to provide $36,000 for the purchase of the electric lighting plant of the Wallaceburg Gas Co., and the installation of a hydro-electric system.

Port Alberni, B.C. — A by-law to ratify the proposed agreement between the city and the Ritchie-Agnew Power Co., for the supply of power from the company's plant at Stamp Falls, will be voted on by the ratepayers shortly.

Waterloo, Ont.—With the installing of a turbine pump in the sixth well at the waterworks the capacity of the plant has been increased from 800,000 gallons to 1,200,000 gallons daily. Of the six wells in use five have an ample flow of water and only in the case of the one must the water be pumped.

Toronto, Ont.—A by-law will probably be submitted to the people next month to authorize a debenture issue of $250,000 to establish a bus service in West Toronto and North Toronto. The controllers have decided to proceed with the matter, provided that the city solicitor finds nothing repugnant in the Gooderham Bill.

Victoria, B.C. — Equipment for the city engineer's department will be purchased by the city as follows: One motor truck and runabout for the water works service, one and one-half ton motor truck for hauling steel from the blacksmith shop, and one five-ton motor truck for general construction account. Bids for this equipment will be called for at once.

Toronto, Ont.—Manager H. H. Couzens, of the Toronto Hydro-Electric System, has been authorized by the Board of Control to proceed with the preparation of a report on the question of establishing a municipal steam plant. The idea is to sell steam for heating purposes to the public, and to provide an emergency source of power to the waterworks and the Hydro system.

Sault Ste. Marie, Ont.—The Board of Arbitrators to decide the amount the city shall pay the Tagona Water & Light Co. for the water and light system on October 14 next, when its franchise expires, fixed the amount at $413,537.51. To this is to be added the statutory 10 per cent., which brings the total to $454,891.26. The Tagona Water & Light Co. in their original figure, asked $724,561.03. By the settlement effected by the arbitrators, the city saves $245,000. The only witness heard in the case was Mr. Edgar I. Sifton, of Hamilton, who was the company's expert. The city has

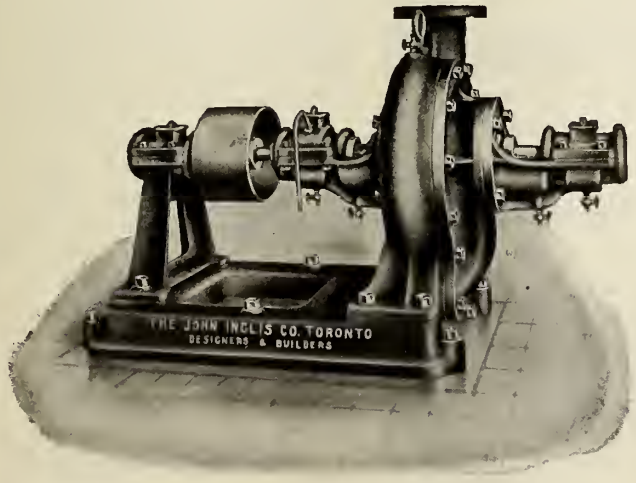
How would you stand to-night if your plant were destroyed by fire?

Yes; your Plant may be fully covered by insurance,—but have you figured out what you stand to lose by not being able to fill prevailing Orders, and not being able to go after new ones—by the trade that goes to your competitors—by the disintegration of a valuable working force caused through unemployment?

By installing

Manufacturers' Automatic Sprinklers

You will prevent disastrous fire and the consequences, and reduce your insurance rates about 80%.



Manufacturers' Automatic Sprinklers will, in five years, pay their cost with the money they save. After this they increase your profit.

Write us for estimates on equipping your Plant. By acting quickly, you may save much trouble and money. **Write to-day.**

six months from October 14 of this year in which to pay the amount.

St. Catharines, Ont.—On the recommendation of the Fire and Light Committee the City Council on May 18, decided to install a new fire alarm storage battery system for the central fire hall, according to specifications, at a cost not to exceed $1,172.25. The Star Electric Co., of Binghampton, N.Y., will supply and install the equipment. A by-law to authorize an agreement between the company and the city for the installation of the new equipment was introduced by Ald. Wiley and passed.

Chatham, Ont.—At a special meeting of the City Council on May 20, the Chatham Gas and Electric Light Co., renewed their offer to sell their plant to the city for $410,000, with the addition of the amount they have spent on capital account since the value of their plant was made by the Hydro-Electric Commission. It is the intention for the city to use the plant of the Gas Company as a distributing station for Niagara power, and to operate the gas end of the business as a public utility. The Hydro-Electric Commission recommended this deal to the city as the best business proposition in installing Niagara power. Later it was reported to the city that the company had withdrawn their offer to this effect. The company made another proposition. The manager, P. S. Coate, stated that if the city would purchase the plant for $300,000 cash and assume the assets and liabilities, the plant would pay for itself in ten years.

General Industrial

London, Ont.—It is considered probable that a public abattoir will be established here.

Ayer's Cliff, Sask. — The Rugg-Ball Mfg. Co., of Sherbrooke, will build a shovel plant here.

Dauntless, Alta.—The Dominion Harvester Co. will erect a factory at an estimated cost of $75,000.

Auburn, Ont.—The Joynt & Todd Co. will buy special machinery for making barrel heads and staves for their new factory here.

New Westminster, B.C.—A company are considering establishing a coffee and spice mill here. Messrs. Otto Becker and Darling are interested.

Cobourg, Ont.—The electors turned out and carried the felt factory by-law by a huge majority on May 22, only twenty-six voting against. The total vote cast was 641. The by-law provides for a conditional loan of $10,000 in aid of a company, promoted by George W. Charles of Montreal, to carry on a felt industry. The company takes over the plant and machinery of the Cobourg Matting & Carpet Co., and is to manufacture felt and other textile fabrics, boots, shoes, and other footwear made of felt, etc.

Brantford, Ont.—The Cut Glass Co. of Toronto have commenced to install their equipment in the upper storey of the Turnbull & Cutcliffe warehouse on King street. The provisional directors are Messrs. Blackley and Reynolds of Toronto, and F. Mann, A. Burnley and T. E. Ryerson of this city.

Building Notes

Hensall, Ont.—A by-law was passed on May 16, for a town hall to cost $5,000.

Toronto, Ont.—The Tip Top Tailoring Co. will erect a six-storey warehouse, 79 x 100 feet, to cost about $55,000.

Toronto, Ont.—A building permit has been issued for a factory to Ladies' Wear, Ltd. The structure, etc., will cost $84,000.

Toronto, Ont.—The Collett Sproule Co., paper box manufacturers, are erecting a four-storey building, 50 x 100 feet, to cost $37,000.

Toronto, Ont.—A building permit has been issued for the construction of a factory for G. Rathbone, Ltd., Cote avenue, costing $5,000.

Toronto, Ont. — The Harris Lithographing Co. have sold their factory building to S. G. Hoffman, who will convert it into warehouses.

Toronto, Ont.—The Robert Bond estate is having a warehouse built to cost about $90,000. The building will be 70 x 150 feet and five storeys high.

Regina, Sask.—A large warehouse will be erected here by Campbell, Wilson & Strathdee. The building will be five storeys high and will cost about $80,000.

Medicine Hat, Alta.—Plans are to be prepared for the new police station which is to be built of brick on the west side of the Armory. It will cost about $15,000.

Toronto, Ont.—A building permit has been issued for the construction of a power house for the Toronto Housing Co., Bain and Logan avenues, to cost $6,500.

Toronto, Ont.—A building permit has been issued for a five-storey brick and steel warehouse to be erected at 79 and 81 Church street, by Cluff Bros., at a cost of $50,000.

Toronto, Ont.—Purdy, Mansell, Ltd., of this city, will build a warehouse to cost about $85,000. It will be 100 x 130 feet and five storeys high. Denison & Stephenson are the architects.

Ford, Ont.—A new addition to the McGregor-Banwell Fence Co., is now under construction by Wells & Gray, contractors. It will be used for an office and will make the main building four storeys high.

Medicine Hat, Alta.—Tenders for the general contract for the technical high school will be received up to June 1, 1914. Full particulars may be obtained from the McCoy & Levine Engineering Co., Medicine Hat.

Port Stanley, Ont.—Excavations have been begun for the warehouse to be built on the docks there in connection with the Port Stanley Railway. The building is to cost from $10,000 to $15,000, and will be adequate for some time, it is believed, for the safe keeping of goods in transhipment from the railway to steamships and vice versa.

Toronto, Ont.—A six-storey fireproof building will be erected at the northwest corner of Yonge and Albert Streets for the Misses M. E. and E. Carty, at a cost of $100,000. It will be of steel, brick, and terra cotta.

Ottawa, Ont.—Tenders will be received until June 5 for a drill hall at Napanee, Ont. Specifications can be obtained from the post office, Napanee, or from the Department of Public Works (R. C. Desrochers, secretary).

Guelph, Ont.—The J. J. Simpson Co. have taken out a building permit for the erection of a large addition to their warehouse at the corner of Paisley and Norfolk Streets, to cost $5,000. W. A. Mahoney is the architect and Johnston & Williams are the contractors.

Winnipeg, Man.—The contract has been let to the Lyall, Mitchell Co. for a handsome new warehouse for the Ames, Holden, McCready Co. The building will be 99 x 132 feet and will cost $100,000. It will be of brick and stone, six storeys in height, and will be equipped throughout with a sprinkler system. J. D. Atchison is the architect.

Wood Working

Listowel, Ont.—The sash and door factory, owned by Nathan Calder, was destroyed by fire on May 22. The loss is estimated at $10,000.

Point Grey, B.C.—A permit has been issued for the new shingle mill of the Hunting, Merritt Lumber Co., which is

to be located on the Higgins' property on the North Arm of the Fraser River at Eburne. The mill structure will cost $15,000, but the total cost, including machinery, will be in the neighborhood of $45,000. The architect is Mr. D. B. Campbell, of Vancouver, and the contractors are the Heaps Engineering Co.

Electrical

Stratford, Ont.—The Light and Heat Commission has decided to extend the ornamental street lighting system.

Clinton, Ont.—Hydro power was officially turned on by Mayor Jackson on May 20.

Athabasca, Alta. — The council are considering installing an electric lighting system. Equipment will be required.

Ottawa, Ont.—Application is to be made to the Governor-in-Council by the Cedars Rapids Manufacturing & Power Co. and the Cedars Rapids Transmission Co., Ltd., for authority to construct a transmission line across the St. Lawrence River from a point on the northeasterly right-of-way line of the Cornwall Canal and joining the line of the St. Lawrence Transmission Co.

Railways-Bridges

Toronto, Ont.—Tenders will be received until June 16 for the fabrication and erection of the steel superstructure of the Strachan Avenue bridge. Specification, etc., may be obtained from the Department of Works, City Hall.

Halifax, N.S. — W. J. Poupore, contractor, has commenced a contract in connection with the new Halifax terminals. The main contract, amounting to six or seven million dollars, was awarded to Foley Brothers, Welch, Stewart & Farquier, and Mr. Poupore's is a sub-contract.

Toronto, Ont.—Apart from the anticipation that the Federal Government will grant a subsidy towards the construction of the proposed Toronto-Markham-Port Perry hydro-electric railway, every thing is in readiness for the commencement of the practical side of the scheme. The Provincial Hydro-electric Commission has drafted the final estimates on cost, maintenance, etc., as well as the apportionment of cost among the various communities benefited.

Refrigeration

Sidney, N.S.—An effort is being made to establish here a cold storage plant of two hundred tons capacity, and, in that connection, the Department of Agriculture at Ottawa, has been approached

with a view to obtaining the usual subsidy amounting to thirty per cent. of the cost. The chief object of the proposed industry is the storing of fresh fish and to make possible the introduction of canning plants at this place. Excellent sites are available at reasonable prices.

Marine

Sault Ste. Marie, Ont.—At the meeting of the board of directors of the Lake Superior Corporation held in the city recently, it was decided to add to the Algoma Central Railway Co.'s fleet by the purchase of a 10,000-ton steamer. The president of the company states that such a steamer is in view, and it is expected that a rapid deal will be put through. This will bring the number of the company's boats up to seven, and should afford increasing prospects for repair work to the Dry Dock Company.

Tenders

Toronto, Ont.—Tenders will be received until June 9 for two motor trucks. Specifications may be obtained from the purchasing agent, City Hall.

Wallaceburg, Ont.—Tenders will be received by the Town Clerk until May 26, 1914, for the construction of a pump house and for the supply of pumping machinery. Specifications may be obtained from Chipman & Power, engineers, Toronto. H. E. Johnson town clerk.

Ottawa, Ont.—Tenders for dredging to be done in connection with Protection Works, Upper Entrance, Soulanges Canal, will be received at this office until Tuesday, May 26th, 1914. Plans and specifications can be seen at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa, and at the office of the Superintending Engineer, Quebec Canals, Montreal.—L. K. Jones, Assistant Deputy Minister and Secretary, Department of Railways and Canals, Ottawa.

Saskatoon, Sask.—Tenders will be received until Saturday, June 20, 1914, for the following:—(A) Two four-million-gallon motor-driven centrifugal pumps, with switch panels and starting equipment; (b) one turbine-driven centrifugal boiler-feed pump, complete with steam separator, gauges and tools; (c) one 75-k.w. motor generator exciter; (d) one 600-k.w. rotary converter and transformers, with switchboard panels, etc.; (e) three 400-k.w. transformers and switch gear equipment; (f) 17,700 feet of 11,000-volt cable, partly armored lead-covered, and partly lead-covered only; and for the laying, jointing and connecting up of same; (g) one mile of 2,200-volt, 4-core, 211,600 C.M. cable, and for

the installation of same in conduit; (h) 9,000 feet of 500,000 C.M. single conductor, double-braided, weather-proof cable. Specifications, etc., may be obtained from Mr. E. Hanson, city electrical engineer, Saskatoon.

Kelowna, B.C.—Tenders in duplicate for the supply of the following apparatus will be received by G. H. Dunn, City Clerk, up to Thursday, June 11, 1914: One—225 B.h.p. vertical, two-crank compound steam engine. One—feed water heater. One—independent air pump and jet condenser. One—150 kilowatt, 2,300 volt, three phase, 60 cycle, alternating current generator for direct connection to engine. One—exciter for direct connection to generator. One—switchboard panel to match present switchboard. Specifications may be obtained from the consulting engineer's branch office at Vernon, B.C. C. R. Yuill, consulting engineer.

Contracts Awarded

Winnipeg, Man.—The Waterous Engine Works Co. has secured the contract for the supply of a 10-ton 12-h.p. steam roller.

Welland, Ont.—The Welland Machine and Foundries, Ltd., have awarded the contract for the erection of their new foundry to W. J. Hickey, of Welland.

Kingston, Ont.—As a result of a test at St. Catharines, the Canadian Locomotive Works has been awarded an order for two engines, in competition with two American concerns.

Bridgeburg, Ont.—The Tuttle & Bailey Manufacturing Co., of Canada, Ltd., has let the contract for their new plant to the Turner Construction Co., of New York and Buffalo. The new plant will, when complete, cost about $50,000.

New Westminster, B.C.—The Westminster Iron Works, of this city, has been awarded the contract for the erection of an ornamental arched entrance to Central Park by the B.C.E.R. Co. The contract was secured in open competition, their tender being $4,000.

Tottenham, Ont.—The following contracts have been awarded:—Water tank, the Hunter Bridge and Boiler Co., of Kincardine; storage basin, the Lewis Construction Co., of Toronto; water pipes and specials, Page-Hersey Iron, Tube and Lead Co., Ltd., of Toronto; hydrants, Darling Pump and Manufacturing Co., of Williamsport, Pa.; valves, London Foundry Co. of London, Ont.; laying pipe, E. J. Hartnett, of Toronto.

HAWKINS LIBRARY OF ELECTRICITY
In 6 Leather Pocket Books Price $1 per Volume

Here is a set of books that no man in the ELECTRICAL FIELD should do without. This is the ELECTRICAL AGE in which we live; ELECTRICITY now controls more trades, directs more men, offers more opportunities than any other power that man has yet discovered. Do you wish to know the underlying principles of MODERN ELECTRICAL PRACTICE?

If so, **HAWKINS ELECTRICAL GUIDES** will give you the information. In reality they are a school within themselves, containing a complete study course with QUESTIONS, ANSWERS AND ILLUSTRATIONS, written in plain everyday language so that a practical man can understand the "HOW, WHEN AND WHY" OF ELECTRICITY.

"THAT'S JUST WHAT I NEED"

Read over the titles shown on the back of each volume, and note the scope of each book. They are handsomely bound in flexible black leather with gold edges and will readily go in the pocket. THEY ARE NOT ONLY THE BEST, BUT THE CHEAPEST WORKS PUBLISHED ON ELECTRICITY.

Each book is complete in itself and will be supplied $1.00 per copy, but we believe that the complete set is the best bargain.

The books can speak for themselves and a careful examination, page by page, and illustration by illustration, will convince you of their big value.

If you will fill out the following coupon giving all the information requested, WE WILL SUBMIT THE SIX VOLUMES FOR EXAMINATION ON CONDITIONS NAMED.

FREE EXAMINATION OFFER

The gathering of the clans

"On to Toronto!"

YOU have doubtless noted with gratification the great movement for honesty and square dealing which is revolutionizing American and Canadian business methods. Our goods, our salesmanship and our advertising are being cleansed and vitalized by the spirit of truth and sincerity.

As a result, we see a growing public confidence in manufactured products and their advertising — a confidence which, if preserved and fostered, will decrease our costs, increase our profits, and become a business asset of incalculable value.

Foremost in the fight which has brought about this revolution stand the Associated Advertising Clubs of America, whose emblem is shown above. If you are a business man, interested in the manufacture, distribution, or selling of commodities of any nature, you should attend the Tenth Annual Convention of the A. A. C. of A. at

TORONTO

June 21-25, 1914

At this Convention you will hear the inspiring story of the manner in which these tremendous reforms are being effected. More than this, you will hear the problems of distribution, merchandising, salesmanship and advertising discussed by able and successful business men, in a series of open meetings.

These meetings will cover the questions of chief interest to the 10,000 business men comprising the 140 clubs of the A. A. C. of A. —*your own* problems included.

EDWARD MOTT WOOLLEY, the famous writer on business topics, has written a booklet entitled "*The Story of Toronto.*" This booklet describes in a forceful, intensely interesting manner, the wonderful work the A. A. C. of A. are doing for clean advertising and square business methods, and the significance and importance of the Toronto Convention. This booklet will be sent free to all business men asking for it on their business stationery—together with detailed facts as to the convention programme and rates for accommodations.

dry Co., cast iron pipe and specials, $5,375; Rensselear Valve Co., Troy, N.Y., gate valves, $800; Western Foundry and Machine Co., Ltd., Saskatoon, manhole frames and covers, catchbasin frames and covers, etc., $1,415; Mackenzie & Thayer, Ltd., Saskatoon, sewer pipe, $7,291; R. J. Lecky & Co., Ltd., laying of storm sewers, $21,109.

Revelstoke, B.C.—The city council, at a meeting held on May 4, made final awards on tenders for a civic water power plant additions, accepting a contract with Escher, Wyss & Co. to furnish a water turbine with 44-inch valve, delivery within four months, at $10,300, and accepting a contract with the Canadian Westinghouse Co. to furnish a generator, exciter, and switchboard, delivery within four months, at $6,993.

Fraser & Chalmers of Canada, Ltd., of Montreal, Que., have been awarded a contract by the Nova Scotia Steel and Coal Co., Ltd., for a 2,000-kilowatt steam turbine, direct connected to an alternator made by Vickers, Ltd., Switch gear and the complete condensing apparatus were also included in the order. This unit will be installed in the same building as the 750-k.w. mixed pressure turbine made by Fraser & Chalmers Co., and purchased by the Novia Scotia Steel and Coal Co. about two years ago.

New Incorporations

The Canadian Railway Institute, Ltd., has been incorporated at Ottawa with a capital of $50,000 to publish scientific books, etc. Incorporators:—F. L. Jones, W. J. Hatch, and C. A. Martin, of Montreal.

The Co-operative Silk Mfg. Co. has been incorporated at Ottawa with a capital of $50,000 to manufacture silk at Montreal. Incorporators:—H. N. Chauvin, H. E. Walker, and J. McNaughton, of Montreal.

The American Textile Machine Co. has been incorporated at Toronto with a capital of $40,000 to manufacture sewing machines there. Incorporators:—J. G. Shaw, J. Montgomery, and H. P. Edge, of Toronto.

The Milk Product Co. of Canada, Ltd., has been incorporated at Toronto with a capital of $200,000 to deal in milk products there. Incorporators:—R. G. Agnew, A. C. McMaster, and F. H. Hurley, all of Toronto.

The Canada Furniture Manufacturers, Ltd., has been incorporated at Ottawa with a capital of $3,000,000 to manufacture furniture at Woodstock. Incorporators:—J. S. Lovell, C. D. Magee, and W. Bain, all of Toronto.

The Berlin Office & Fixture Co., Ltd., has been incorporated at Toronto with a capital of $60,000 to deal in all kinds of office fixtures, etc., in Berlin. Incorporators:—S. Brubacher, J. H. Woolner, and J. Ruddy, all of Berlin, Ont.

The American Oil Processes, Ltd., has been incorporated at Ottawa with a capital of £3,100,000, to carry on the business of oil refiners there. Incorporators:—W. G. Bronson, W. C. Perkins and H. D. McCormick of Ottawa.

The Hutchinson Woodworker and Contracting Co., Ltd., has been incorporated at Toronto with a capital of $40,000 to carry on the business of contractors there. Incorporators:—M. K. Lennox, B. F. Fisher, and E. LaFontaine, all of Toronto.

The George Taylor Hardware Co., Ltd., has been incorporated at New Liskeard with a capital of $250,000 to carry on the business of wholesale and retail hardware merchants there. Incorporators:—G. Taylor, W. A. P. Taylor, and J. Taylor, all of New Liskeard, Ont.

The National Rubber Co., Ltd., has been incorporated with a capital of $500,000, divided into 5,000 shares of $100 each. The headquarters will be in Hamilton, Ont., and the incorporators are: George Wenig, David B. Wood, Richard Long, Charles Boyd, and Frank E. Walker, all of Hamilton. The company will manufacture all types of rubber goods, including boots, coats and automobile tires.

Catalogues

Welding and Cutting Plants, is the subject of a catalogue issued by the Waterhouse Welding Co., Boston, Mass. The company make several sizes of equipment which are illustrated and accompanied by a list of parts included with each. A list of supplies with prices are also included.

Spring Machinery.—Sleeper & Hartley, of Worcester, Mass., and Coaticook, Que., are distributing two bulletins, No. 277 and 280, dealing with spring hooking machines and special spring coiling machines, respectively. The principal features of each machine are described in detail and particulars given covering the range of work and power required to operate. The bulletins are illustrated.

Mechanical Draft is the title of catalogue No. 22, recently published by Sheldon's, Ltd., Galt, Ont. Mechanical draft is dealt with in all its phases, as are also the relative merits of forced and induced draft. The various types of equipment which the company make are illustrated and briefly described. The catalogue contains some interesting

METAL STAMPINGS

We are manufacturers of stamped parts for other manufacturers. We do any kind of sheet metal stamping that you require. Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time. We can finish steel stampings in Nickel, Brass or Copper. Send us a sample order.

data on fan capacities and water pressure.

Storage Batteries for Electric Lighting Plants.—The Canadian General Electric Co., Toronto, have published a book of information about the above which will be useful to those interested in such equipment. The booklet contains a deal of information concerning the "Hyray" battery and the "Chloride Accumulator," both made by the Electric Storage Battery Co., Philadelphia, Pa. The booklet is fully illustrated.

Morris Traveling Trolleys.—Bulletin B5, is devoted to a description of the "Morris" flexible-bogie and flat bar trolleys made by the Herbert Morris Crane & Hoist Co., Ltd., Toronto. Inlustrations show the application of these trolleys and the types of lifting gear used. Tables are included giving the principal sizes and other information. One page illustrates a number of ungeared traveling trolleys with a table giving particulars.

"Modern Lighting Practice in the Clothing Industry" is the title of bulletin No. 43401 which we have received from the Canadian General Electric Co., Toronto. The bulletin contains several illustrations showing interior views of clothing factories and installations of "Mazda" lamps. The reading matter deals with modern lighting practice in clothing factories in conjunction with the application of "Mazda" lamps. Three tables are included giving particulars of the various sizes and types of these lamps.

Turbine Governor.—We have received from Mr. Percy H. Pitman, a reprint of an interesting paper on an improved governor for water turbines, which was read before the Institution of Mechanical Engineers, London, England. The governor is, of course fully described in this paper, and the claims made on its behalf discussed in detail, the principal one being that it gives a most perfect speed regulation. The governor is made by Mr. Pitman at his works, Acton, near London, England, where water turbines are also made.

Generating sets, made by the Enberg's Electric and Mechanical Works, St. Joseph, Mich., are described fully in bulletin No. 24 recently issued by the company. The "Enberg" generating sets are made in sizes from 2½ to 50 kilowatt, and two tables are included giving the weights and principal dimensions for each. The illustrations show the principal features embodied in the construction of engine and generator. Copies of this bulletin may be obtained from the Canadian agents, the A. R. Williams Machinery Co., Toronto, Ont.

Tool Hardening by Gas

The use of the gas furnace for forging, tempering and hardening steel is gaining ground among the workshops where cutlery and tools are made. The old "hearths" are disappearing, replaced by small, clean gas furnaces, which are not only economical in space and cost of running, and comparatively clean and neat, but furnish a uniform temperature of any desired heat, thus avoiding damage to the steel through "burning" or irregularity of temperature. We handle tool-hardening furnaces.

THE DICTAPHONE Girl
(REGISTERED)

"Easy! Why, I just listen to Mr. Smith's voice and write out what he says on the typewriter. I can regulate the Dictaphone to my typewriting speed, and then if I *do* happen to miss a word, there is a back spacer just like on my typewriter, and when I press it Mr. Smith's voice obligingly says the last few words over again.

"I don't have to risk my life any more by asking him to repeat—you know how Mr. Smith hates to be interrupted. It always makes him forget what he was going to say, and then he goes right up in the air.

"Yesterday I wrote 80 letters and if I had had to take them down in shorthand first, I'd have had to stick around here until all hours. As it was I got them all done in plenty of time.

"Eye strain! I'm through with *that!* And 'cold notes' don't worry *me* now. What's more, my letters are *right*. And why shouldn't they be? I copy his own words, instead of copying my notes of his words.

"I hope I never see a shorthand note-book again! I'd just as soon give up my typewriter and go back to writing letters in long-hand.

"Yes and I didn't like the idea of the Dictaphone when I started, either."

Demonstration in your own office on your own work.

SCHUCHARDT & SCHUTTE -:- 42 Adelaide Street West, Toronto

The advertiser would like to know where you saw his advertisement—tell him.

Few Reasons Why

"CAMEL HAIR" "CAMEL" BRAND BELTING

should be in use in your plant

It reduces slippage one-half, thus transmits more power. Will run equally well in damp, wet, or a dry atmosphere. It is uniform in thickness and runs true.
Stretch comes out quickly and after taking up once or twice (according to load and nature of run), requires little or no more attention.
It is exceedingly durable—almost twice as strong as best oak-tanned double leather.
The belting itself will prove these claims — give it a trial.

Agnew
Spot and Butt Welding MACHINES

Do the Work Rapidly and Economically

We are the pioneer builders of Electric Welders in Canada. If you do any quantity of welding or riveting you should investigate, at once, the merit of AGNEW Electric Welders. Let us study your welding problems and advance our ideas regarding your particular work.

Our machines are of the highest electrical efficiency, and we find by actual meter tests that they will in all cases do a given amount of work with less consumption of current than any other machine on the market.

We have good facilities for demonstrating these claims and the intending purchaser of electric-welding apparatus who expects to use a considerable amount of electric current should investigate this feature.

No. 21-D Spot Welder

will spot-weld from No. 30 to No. 10 sheet metal.
Depth of throat, 14 inches.
Adjustment of lower horn, 7 inches.
Water-cooled reversible points.
Height of dies from floor, 40 inches.
Floor space, 18 x 32 inches.
Transformer capacity, 15 K.W.
Operated either by foot-lever or belt power, leaving operator free to use both hands.
Speed 100 to 160 welds per minute.

No. 10-C Butt Welder

Capacity ⅛ in. to ⅝ in. round, ⅛ x 2 inches flat, stroke of movable carriage, 3 inches.
Adjustment of clamps, 1¼ inches.
Vertical adjustment of fixed carriage, ¾ inch above and below movable carriage.
Tilting adjustment of 10 degrees.
Transformer capacity, 10 K.W.
Height, floor to dies, 32 inches.
Will weld any length Butt or Tee.

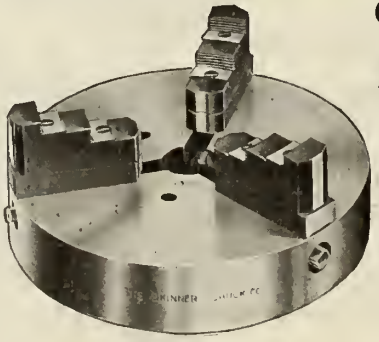
"CUSHMAN" CHUCKS

are generally known as the "heavy pattern," being designed for hard service.

Their accuracy and reliability have been proven over and over again, and the name "Cushman" on your chuck is a guarantee of satisfaction.

Our line consists of many styles and sizes of Lathe Chucks, Drill Chucks, Centering Chucks and Face-Plate Jaws.



Catalog Free

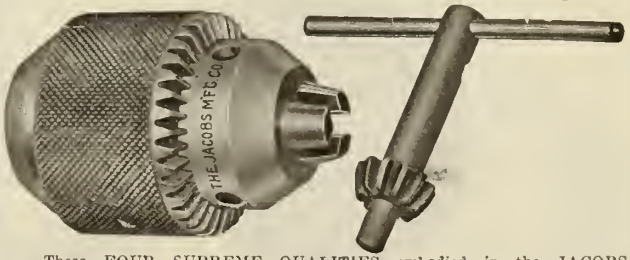
THE CUSHMAN CHUCK CO.

Hartford, Established 1862 Conn., U.S.A.

Skinner Universal Chuck

Geared Screw Type

For extremely accurate work, this chuck has no equal. It is made also in the Combination pattern with three or four jaws.



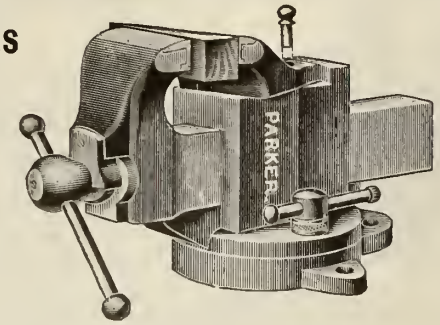
New catalogue just issued. Copy?

THE SKINNER CHUCK COMPANY

Factory and Main Office, New Britain, Conn.

FOUR SUPREME QUALITIES!

Whenever the JACOBS IMPROVED DRILL CHUCK is mentioned, it suggests to more than 160,000 Jacobs Drill Chuck users convenience, efficiency, accuracy and durability—FOUR SUPREME QUALITIES—embodied in the JACOBS IMPROVED DRILL CHUCK.



These FOUR SUPREME QUALITIES embodied in the JACOBS IMPROVED DRILL CHUCK should influence your selection, rather than the lesser cost of any other Chuck.

OUR 34-PAGE ILLUSTRATED CATALOGUE C SENT UPON REQUEST.

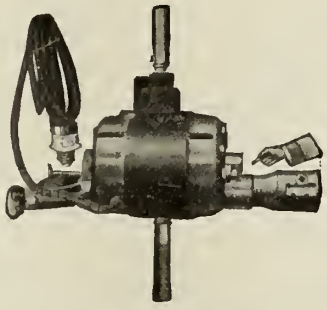
U. S. Electric Drills and Grinders



Save Time, Labor and Money

They can be attached to any lamp socket. For drilling in metal they are superior to any other kind of portable drill. Cost 50% less to run than air drills.

3 SIZES.
3-16 inch, W.G.T. 6 lbs.
¼ inch, W.G.T. 9 lbs.
⅜ inch, W.G.T. 12 lbs.

All motors wound for 110 or 220 volts. Direct or alternating current.
Try a few of our Electric Drills and Grinders and you'll send us an order for more. Our guarantee protects you.

½ inch—2 SPEED.
Speed, 400-750 R.P.M.

For Sale By
The Canadian Fairbanks-Morse Co., Limited
Montreal. St. John, N.B., Toronto, Winnipeg, Calgary, Vancouver.

THE UNITED STATES ELECTRICAL TOOL CO.
CINCINNATI, OHIO

Let the "Brazo-Hardening" Process Save Half Your Reamer Costs

The benefit accrues to you in this way. Our

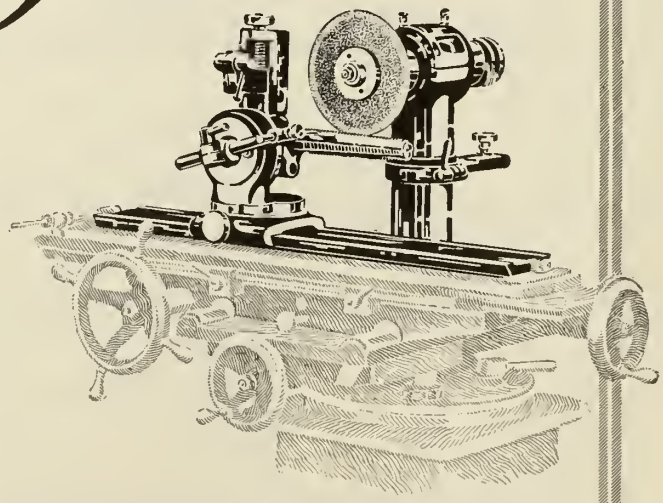
"PEERLESS" HIGH-SPEED REAMER

has blades of the finest quality, selected high speed steel, solidly joined by our patented "Brazo-hardening" process to a one piece soft steel body. We can thus provide durable cutting edges and a soft, tough supporting body at about half the cost of other high speed reamers.

"Peerless" Blades *never come loose* — a new reamer if they show evidence of such a defect. That's a liberal enough guarantee to make you interested in full details.

Ask for Catalog No. 36-C.

The CLEVELAND Twist Drill Co.
New York CLEVELAND, OHIO Chicago



Do You Consider the Life of Your Tools?

When you grind tools with properly selected

Norton Alundum Grinding Wheels

you will obtain a cutting edge that will show the longest life. A wheel that will not burn, check nor "skin soften" the tool must be of a special temper as well as of the correct grain and grade. In producing this special temper, the highest skill in abrasive manufacture is demanded.

Norton Company, Worcester, Mass., U.S.A.

The Rivett Dock Thread Tool

Should be in Every Machine Shop, Garage, Factory

in fact wherever accurate and uniform threads must be cut.

It may be used on any ordinary Engine Lathe; about two minutes' work to set it up, squared up with an ordinary Scale right against the face plate.

We have the Tools in Stock, also a large variety of Cutters.

It may cost you a few dollars to come to Toronto to see this electro-plating demonstration plant

but we can show you that its service means a better quality of work and immense economy

DEMONSTRATING PLANT OF THE CANADIAN HANSON & VAN WINKLE CO., Limited.

This installation has been arranged so that practical demonstrations can be made of all kinds of electro-deposition of Metals, oxidizing, and all classes of finishes, showing the most modern methods known to-day.

We have installed our Interpole Dynamo, which is the latest type of Low-Voltage Generator, directly connected to suitable Motor by means of a flexible coupling, all mounted on a sub-base. This Generator is also equipped with our new graphitized, self-adjusting, non-sparking brushes, which eliminate all possibility of scoring of the commutators and guarantee an even distribution of current.

A special feature has been made of Mechanical plating, showing in operation the several types of barrel apparatus.

Electro-Cleaning has also received special attention, showing the possibilities and advantages of this process.

A complete Lacquer Room has been equipped, using Compressed Air and the latest type of Air Brushes for producing all Lacquer finishes.

As this Plant is modern in every detail and will surely be of great advantage to the Canadian trade, we will be very pleased to have a visit from those interested and to do any class of work requested.

Who Wants Your Order?

¶ The firms that are most likely to appreciate your order are the ones that are keenest to get it.

¶ The firms that advertise are bidding for your business in a broad, yet personal way,—the modern way. They are proud of their goods and are not ashamed to show them in public to the most critical.

¶ Patronize the firms that advertise. Consult this directory of machinery manufacturers and supply houses and you will connect with good concerns.

¶ A firm that appreciates your order will serve you well.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

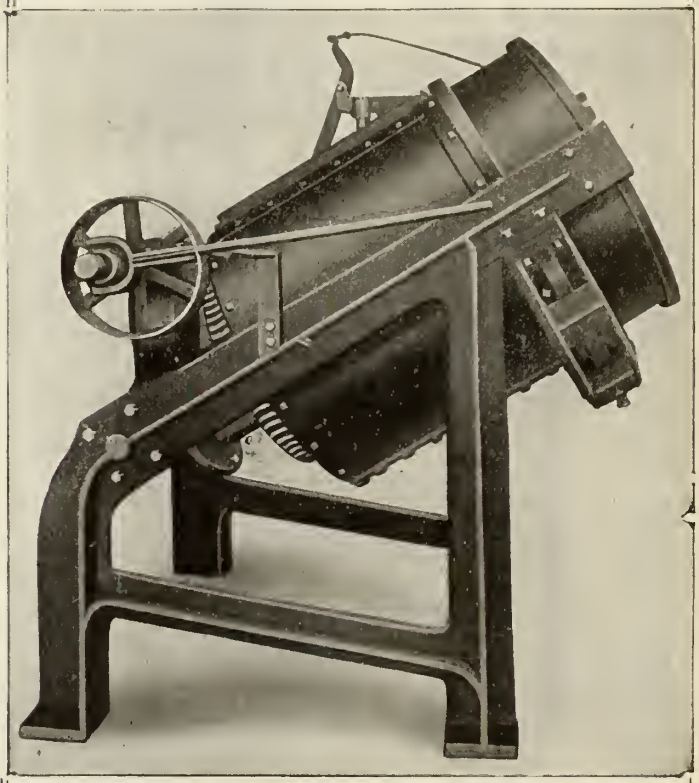
QUALITY ALUMINUM BRASS



We specialize in Pulp Mill Acid-Resisting Castings of all kinds
Best equipped foundry in Canada.
Capacity 20.000 lbs.
Can make castings up to 5,000 lbs.

ALUMINUM CASTINGS
Limited
Ottawa, Ont.

CASTINGS

The "No-Wear" Nozzle

An exclusive feature of the
"Sly" and Satisfaction

And there are many other features that make

"SLY" SAND BLAST MILLS

the last word in equipment of this kind.

HERE ARE A FEW OF THEM:

Massive and solid construction, with large wearing surfaces. Barrel of steel plate 1 in. thick. Sand and dust are thoroughly separated. Blasting sand is automatically returned to the nozzle for continued use.

Perfect balance of the machine makes 1 or 2 H.P. sufficient for operation.

Machine can be adjusted without stopping.

We will be pleased to get you in touch with users, so that you can profit by their experience.

Ask for full particulars.

The W. W. Sly Mfg. Co.

CLEVELAND, OHIO

Complete Sand Blast Rooms and Equipment a Specialty

Now here's advice right off the reel: In crucibles for gold or steel, get Dixon's and one square deal

Joseph Dixon Crucible Company ESTABLISHED IN 1827 Jersey City, N.J.

THE DUPONT
Improved
Power Hammer

is constructed of such materials and in such proportions as to insure greatest durability.

For instance, the ram is overheated; links, sidearms, sleeve and connections are steel castings; the crank and joint pins of forged steel. The two springs make the action more elastic and increase the life of the hammer.

The entire working parts are at the top in full view of the operator and are readily accessible. Inexperienced men are able to operate satisfactorily and make the necessary adjustments.

Runs with an exceptionally small amount of power.

Write for full details.

PLESSISVILLE FOUNDRY, Plessisville, Que.

The advertiser would like to know where you saw his advertisement—tell him.

No, Stevens' Stopper won't stop a train, but it will stop the blow hole in a defective casting so that you cannot find it.

In this way, it helps your bank account. The casting that otherwise would have to go to the scrap heap can be converted into good coin of the realm.
Same color as the rest of the casting. Doesn't look like a blue patch on Casey's faded overalls.
How to use Stevens' Stopper, or Circle Cement:
Stevens' Stopper is a fine powder, used with a little water and made into a paste—the hole is easily filled with a putty knife or trowel. It takes anywhere from two to twenty-four hours, depending upon the size of the patch, for the filler to become as hard as the casting itself. When rubbed with a file it shows the color of the casting, hence it is the best filler and the one thing that saves your castings. and that means the saving of your dollars.
Another thing—I do not ask a fancy price for it.
A pound will save many dollars' worth of castings. Put up in 5-lb., 10-lb., and 25-lb. cans.

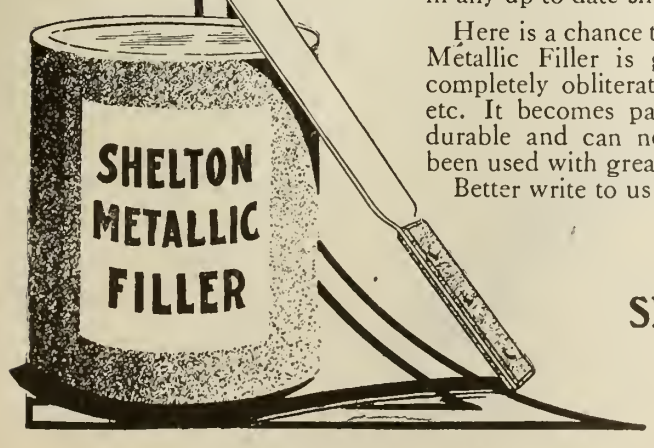
A sign of good profits



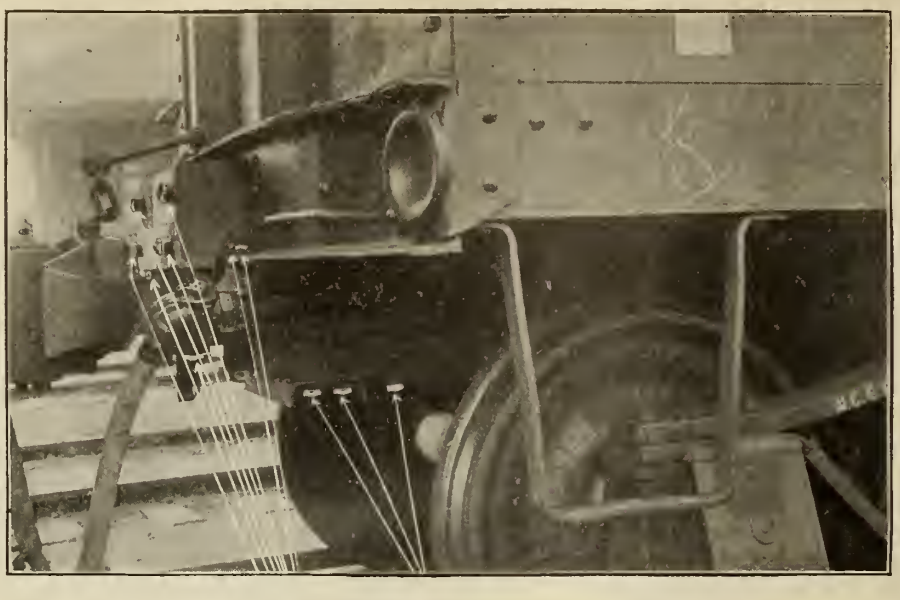
FOR YOU--FOR EVERY FOUNDRYMAN

Shelton Metallic Filler

is a guarantee for *bigger results* in any foundry ---it eliminates *make-overs.*

Make-overs are the profit consumers of the foundry. They are a form of waste that is absolutely useless, and should not be permitted in any up-to-date shop.

Here is a chance to stop your losses. Shelton Metallic Filler is guaranteed to fill in and completely obliterate blow holes, sand holes, etc. It becomes part of the casting itself, is durable and can never be detected. It has been used with great success for many years.
Better write to us at once.



Every casting means a profit if you are a user of SHELTON METALLIC FILLER
At a slight cost the "bum" casting can be made as good as the *best---don't throw it on the scrap heap.*

Test Wilt Twist Drills On Two Points

The number of holes of a given size that they will drill per hour—and—

The number of holes they will drill before wearing out.

The important thing to remember is that when you buy a drill you are really buying holes.

Wilt Twist Drills are made of the finest, most carefully selected steels that can be bought. They are made by a new antomatic process that machines them complete at a single chucking — insuring a degree of accuracy and uniformity that cannot be secured in any other way.

Try them on your hardest job. Ask your supply man.

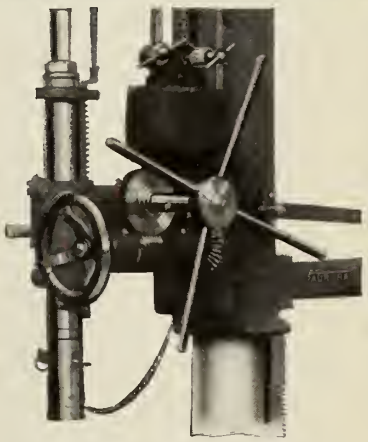
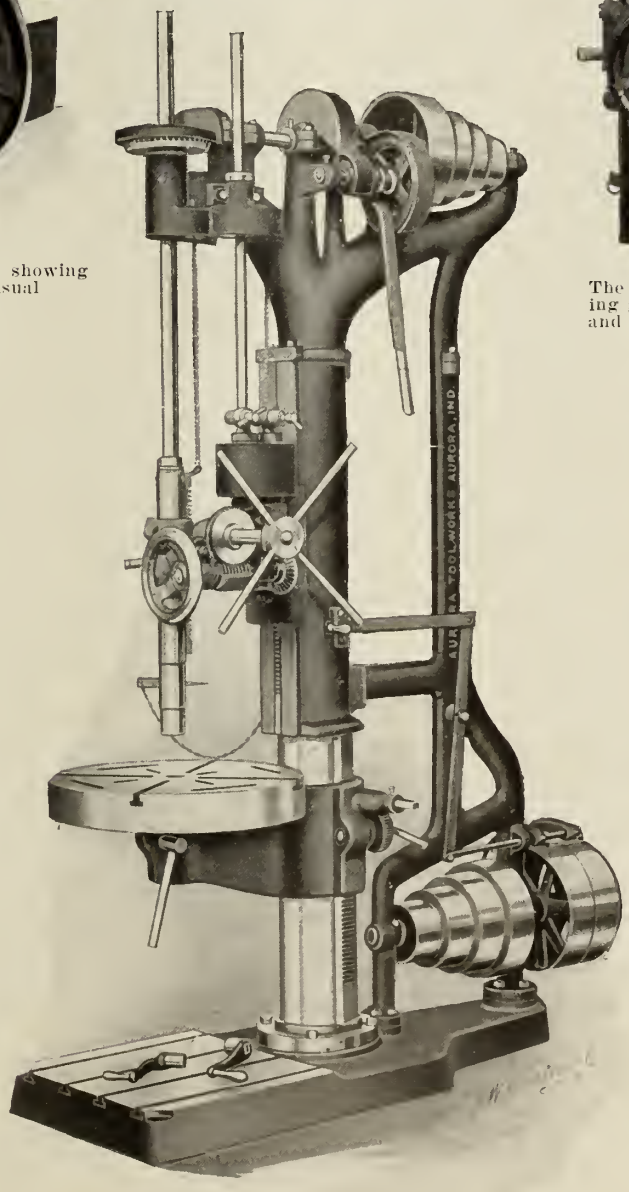
CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields. Published by the MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng.



MONTREAL, Eastern Townships Bank Bldg. TORONTO, 143-149 University Ave. WINNIPEG, 34 Royal Bank Bldg. LONDON, ENG., 88 Fleet St., E.C.

Vol. XI | Publication Office: Toronto, June, 4 1914 | No. 23



The "Aurora" is some drill. The choice of the leading Master Mechanics, Factory Managers and Supts.

The Table Arm with Table removed, showing the large flat bearing besides the usual pivot bearing.

The head of an Aurora Drill, showing geared feed. All gears hardened and run in oil. Each feed designated.

Rapid Production

WHY?

Pulleys are of large diameter and carry a wide belt. Large gears are made of a special semi-steel, small gears of steel. Spindle Bevel Gears are 3 to 1 ratio. Six feeds, any one of which are instantly obtained directly at the hands of the operator.

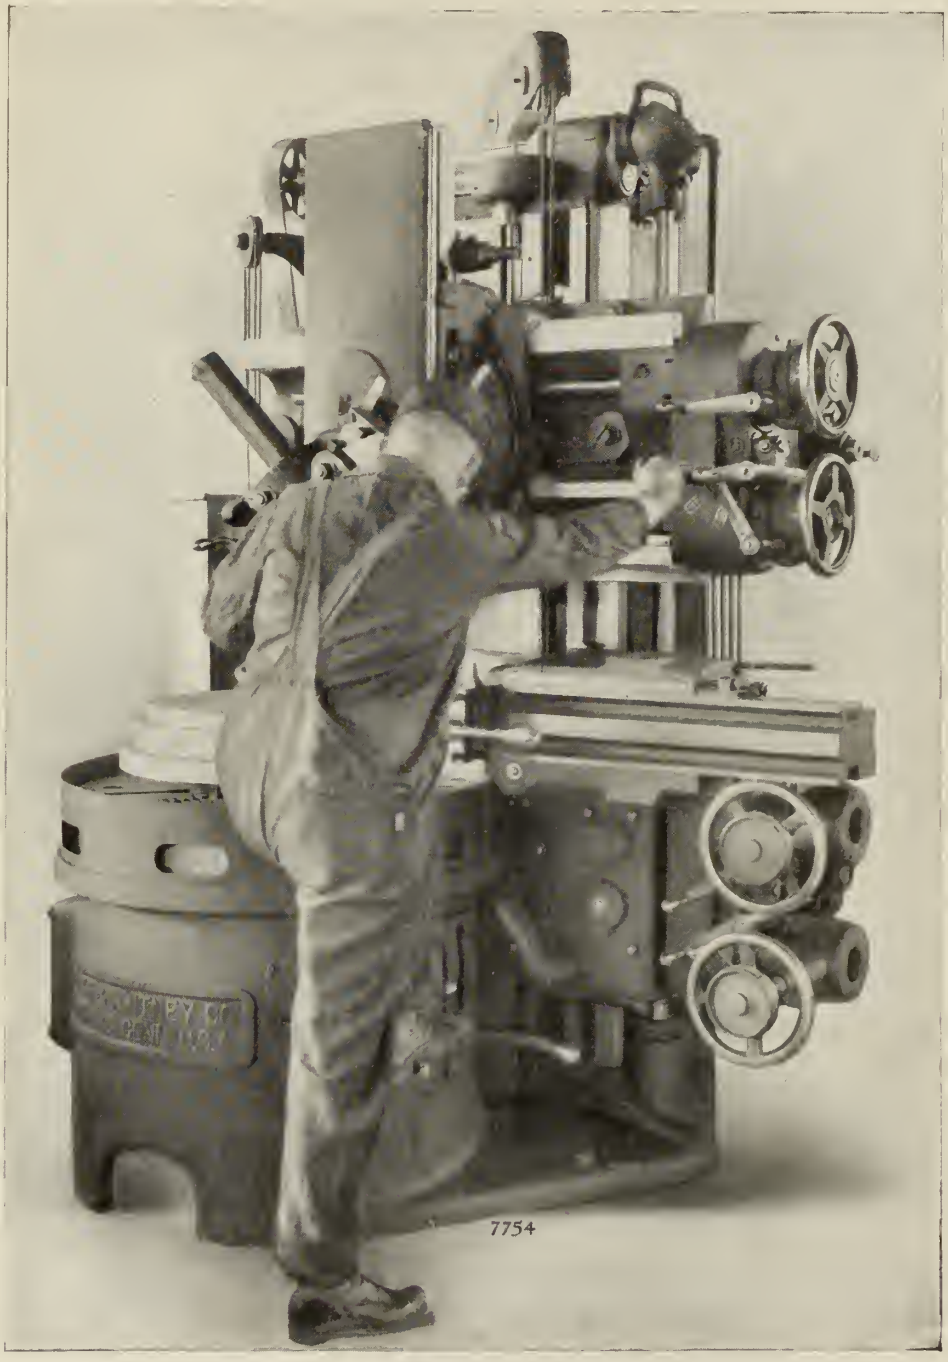
Sliding Head Type, 22", 24", 26", 28", 32", 36", 40" and 44".

Accurate Work

WHY?

Column is heavy and well ribbed. Table is well supported by large flat bearing. Table Arm and Head have long bearings on column. Back Brace is heavy and well fitted.

Stationary Head Type
20", 21" and 25".



The Aurora Tool Works, Aurora, Ind., U.S.A.

Like Driving An Automobile

Operator Can Engage Clutch or Brake, and Change Speed by Foot, at the Same Time Controlling Rapid Traverse and Feeds by Hand.

The Speed Levers on the

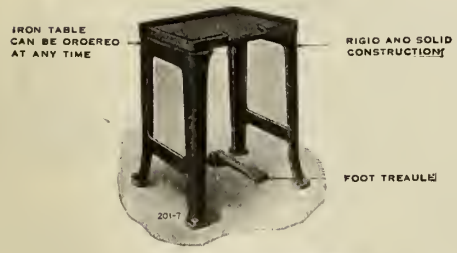
P. & W. 36-44 inch Side Head Boring Mill

are so conveniently located and easily operated that they may be controlled by foot as readily as by hand.

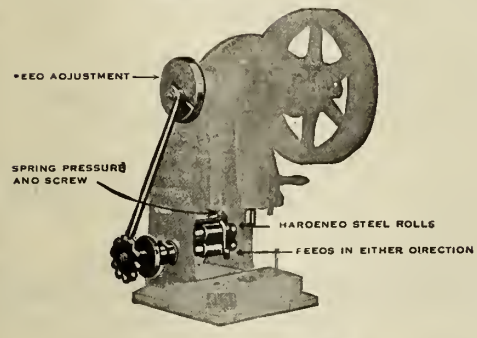
"A Pleasure to Operate This Machine," says an experienced boring mill hand.

SOME REASONS WHY:

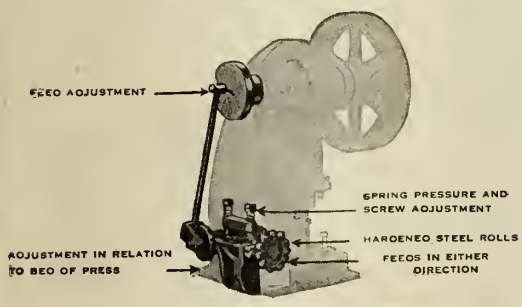
1. All controlling levers within arm's reach.
2. Power rapid traverse instantly engaged to both vertical or side heads in either direction. By one lever, operator can engage either feed or rapid traverse or instantly shift from one to the other.
3. Twelve table speeds controlled by two levers directly below table.
4. Gearing of new, selective sliding gear type. All gears of alloy steel, heat-treated and hardened.
5. Control levers in all cases advanced in direction which movable member is to travel.
6. Starting lever operates vertically so that after releasing from upper position it drops by own weight, and table brake is automatically engaged.
7. Complete absence of exposed gearing and any moving parts which could injure the operator.
8. Complete system of flood lubrication, including all gear units.
9. The vertical location also makes it impossible to start machine accidentally. When starting-lever is engaged the speed change levers are automatically locked. Furthermore the speed levers are interlocking, so that it is impossible to cause injury to the machine through improper manipulation.



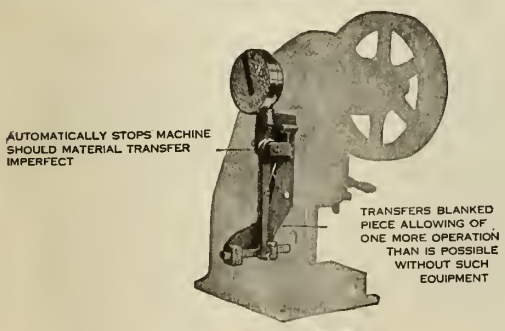
Write for new illustrated catalog, "Side Head Boring Mill."



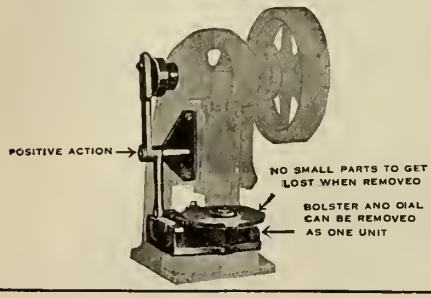
Pratt & Whitney Company, Hartford, Conn., U.S.A.



SALES AGENTS FOR CANADA:



THE CANADIAN FAIRBANKS-MORSE CO., Limited, Montreal, Toronto, Vancouver, Winnipeg, St. John, Calgary

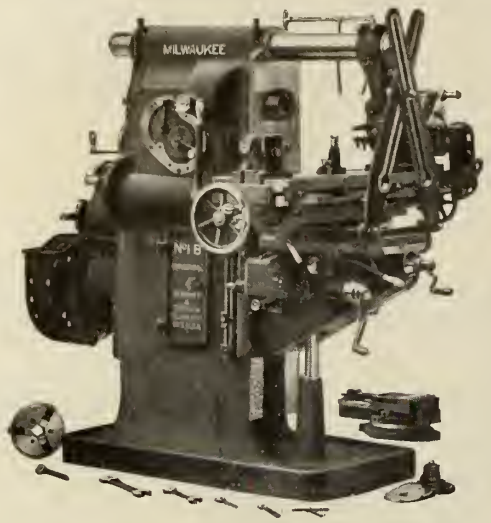


$58 OPENS THE WAY FOR FULL AUTOMATIC MACHINERY

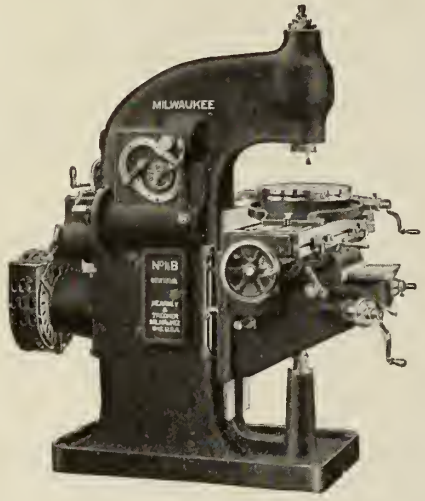
Our Open Back Power Bench Press No. 201 has been reduced to the very elementals of flexibility in equipment. Either Single or Double-Action Presses can be supplied.

The Plain Press can be purchased—as illustrated, to be fastened to a bench. Or a complete Press with Iron Table and Legs can be ordered. The Table can be ordered with the Press or it can be ordered at any time in the future. Both Press and Table are standardized.

A Back Roll Feed can be ordered with the Press or it can be ordered whenever requirements make it necessary. This Feed takes the metal from a reel and automatically draws it under the tool ready to be operated upon. It feeds in either direction, front to back or back to front, and by adjustment moves the metal forward any predetermined distance at each operation. There is no chance of accident when this attachment is applied as it takes away the necessity of hand operation and makes the Press a Full Automatic Labor Saving Machine.



A Side Roll Feed can be ordered with the Press or at any future time. This takes the metal from a reel in a similar manner to Back Roll Feed, but being attached to side of Press feeds the metal across the bed from right to left or left to right as may be desired. It allows of greater operating space for tools as the metal travels across the greatest width of bed and punch block. Rolls can be adjusted in relation to bed of press.



A Transfer and Automatic Stop Attachment can be ordered with Press or at some later date. This is used in connection with Back Roll Feed. After Press has reached the limit of operation under regular equipment the Transfer carriers or transfers the blank into position for one more operation. It allows one additional operation without rehandling to what would be possible without such attachment.

A Dial Attachment may be ordered with the Press or at any future time. A Dial Attachment will handle small partly finished objects with speed where it would be both dangerous and slow to feed directly to the tool by hand. Lift Pin for Dial and other variations of attachments making them suitable for particular purposes can be fitted.

Bulletin No. 201 gives Full Details and can be had for the asking.

The BAIRD MACHINE COMPANY
BRIDGEPORT CONN.

Milwaukee Millers

The Choice of the Superintendent

The Superintendent is responsible for results from men and machines. If the men don't produce, he fires them. But he can't fire a machine without losing a good amount of money.

Considering the care and thought which the Superintendent must give to the selection of a machine, it is important to know the reasons why most Superintendents choose Milwaukee Millers.

Column. Box-section, semi-steel casting, deep, rigid and heavily ribbed. Openings as few and as small as possible.

Knee. Box-section, semi-steel casting with solid top. No slots or holes to spring or close when cutting strains or clamping strains are applied.

Table. Semi-steel, amply proportioned and finished on both sides.

Double Over-Arm. A patented Milwaukee feature which makes for greater rigidity and provides for a positive alignment of the arbors.

Arm Braces. Light, conveniently applied.

Flanged Spindle. Another patented Milwaukee feature. Prevents collars and cutters from giving trouble when being removed from the spindle; permits running of cutters either right or left-hand, and shields the end of the spindle.

Cascade Lubrication. A patented Milwaukee feature. A gallon of oil per minute cascades through open grooves over gears and bearings in the machine, lubricating and flushing away all substances that might cause scoring and heating.

Cutter Lubrication. Furnished with all Milwaukee Millers. Patented. An essential when working in steel.

Constant Speed Drive. We are the only milling machine builders who build this type of machine exclusively. All gears in speed (and feed) arrangement are of hardened steel. The constant speed drive gives maximum results at all times, irrespective of speed or size of cutter.

Speeds. 18 changes obtained with 10 gears. Changes in geometrical progression with a ratio of approximately 1.25 to 1. Easily accessible and computable.

Feeds. 12 changes in geometrical progression with ratio of approximately 1.35 to 1. Minimum ½" per minute. Maximum 16" per minute. No two feeds can be accidentally placed in operation at one time.

Convenience. The number of levers has been reduced to a minimum. All operating levers are placed convenient to one operating position. Careful provision made throughout for adjustment to wear. No countershaft required.

Attachments. All attachments for Milwaukee Millers are as well designed and well made as the machine itself. They include — Vertical Spindle attachment, Universal Milling attachment, Slotting attachment, Dividing centers, Rotary table, Rack-cutting attachment.

This is a very brief summary of the manifold advantages of Milwaukee Millers. A much better idea can be had by getting our Bulletins. Better still, ask the Superintendent of any shop now using our machines.

Write for our complete Bulletins. We will send them to you immediately and also put your name on the list for a copy of the Kearney & Trecker Catalog No. 19, which will be ready about June 1.

We are pleased to have you consult us on any milling problem.

The Value of
Any Core Oven

depends upon the way the heat is delivered to the cores. If the heat is uneven—not the same from one side of the oven to the other—the cores will be baked unevenly, many of them will have to be made over and many of the others will produce poor castings. This will give the establishment a "black eye," and cannot be justified on any grounds.

CRAWFORD
Sectional Ovens

deliver superheated air, constant in both quantity and temperature, while the design of the oven keeps the heat uniform all over the interior. As the air comes from a positive pressure blower, perfect combustion is obtained in the **Enclosed Flame Gas Burner** and the results are bound to be satisfactory. If the cores are properly made before they are put into the oven, they will come out perfectly baked.

Can You Caliper Over a Flange?

Ordinary outside calipers cannot be withdrawn over a flange on a hollow cylindrical piece or similar work, without losing the measurement. Nor can inside calipers measure an interior dimension through a smaller opening. But this work can be done, and done accurately, with the

Starrett
Lock-Joint Transfer Calipers

These calipers were invented and patented by Mr. L. S. Starrett. The pictures above show the use of these calipers (outside style). In the circle at the left, the calipers are being set at the thickness of the casting, below the flange. In the circle at the right, the leg of the calipers is swung out to permit removing the tool over the flange. But note that the short leg is still in the position determined by the thickness of the casting. In the lower circle the leg is swung back to the short leg and the opening between the points may be read from the rule as with an ordinary caliper.

Every shop should have a set of these calipers in both inside and outside styles. Write for free catalog No. 203, describing the full line of Starrett Tools and Hack Saws.

Starrett Tools are sold at all good hardware stores.

Sparks can not burn J-M Asbestos Roofing

On the plant of the Medina Foundry Co., Medina, O., J-M Asbestos Roofing has for years withstood a *continuous shower of sparks* from a cupola stack.

Scores of cases are on record to prove that J-M Asbestos Roofing has saved buildings from destruction by resisting the action of burning brands and embers blown from adjacent fires.

J-M Asbestos Roofing affords *excellent fire protection.* Fire, chemical fumes and weather have no effect on it—because it is *all mineral,* and therefore practically indestructible. Composed of layer upon layer of Asbestos Felt cemented with Trinidad Lake Asphalt. Literally a sheet of *pliable stone.*

Cheapest-per-year Roofing

J-M Asbestos Roofing contains nothing to rust, rot, peel or crack. Never needs coating or graveling. *Its first cost is the only cost.* Adapted to all buildings. Easily applied. J-M Roofing Cleats, packed in each roll, make absolutely watertight laps and give the entire roof a handsome white appearance. J-M Roofing also comes in built-up form. We ship direct if your dealer can't supply you.

We are also prepared to furnish J-M Regal roofing which, although low in price, is the highest grade rubber roofing on the market.

No. 95 Double Crank Press, Geared

"For Rigidity of Construction, Simplicity and Ease, You Can't Beat the 'BB' Press."

Our Double Crank Presses are used very extensively in the manufacture of large sheet iron and steel goods, such as steel ranges, metal shingles, paneled ceiling, and siding for buildings, cornice work, drip pans, armature discs, etc., and gang punching. They are particularly desirable where dies extending over a large area are used. The two pitmans are so connected that they are always adjusted simultaneously, thus enabling the operator to quickly raise or lower the slide to suit thickness of dies without any danger of getting the face of slide out of alignment with bed of press. For heavy work the presses are geared.

Secure copy of our Press catalogue, and let us quote on your next press.

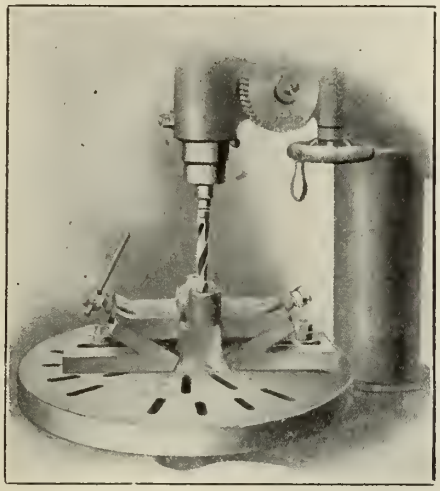
DIAMOND SAW & STAMPING WORKS
BUFFALO, N.Y., U.S.A.

Make One Barrel Do What Two Barrels Did Before

THE minute you install one Globe Tumbling Barrel you can pension two of your old-fashioned horizontal barrels and still do a wider variety of work—and do it a great deal better and many times faster.



GLOBE TUMBLING BARRELS

save time because they don't have to be stopped for filling, emptying or inspecting of the work. They save floor space, because they stand vertically and occupy little room—and they save money, because they require a smaller investment in barrels.

Eight stock sizes, $50 to $170. Our Booklet 2 contains useful information on tumbling — shows the different styles of Globe Barrels and tells what each will do. Write for a free copy to-day.

The Globe Machine & Stamping Co.
Cleveland, Ohio, U. S. A.

A Wonderful Vise

The S. & S. Divided Machine Vise

has unlimited capacity. It is suitable for use on practically any machine, and holds work up to full length of table. Holds Parallel, Taper and Irregular articles—the lightest as well as the heaviest work. Has a combined parallel and downward movement of the jaw which forces the job down to the table, saves the operator the use of a hammer.

Get full particulars. Write to-day for Special Bulletin.

Fairbanks - Morse Internal Starter Motors for Heavy Starting Duty

A motor that has been wanted for a long time. Controlled by simply closing or opening the line switch. The complicated starting apparatus of other types of motors is entirely eliminated. They are particularly adapted for use on circuits of small capacity where starting squirrel cage motors would cause too great a disturbance of voltage. For remote control they are unequalled. They are uninjured by interruption and restoration of current supply. They simply stop when current is cut off and start when it is restored.

Light or heavy loads are automatically accelerated and a minimum amount of electrical energy is consumed.

A starting torque of 200% full load running-torque may be developed with less than one-half the amount of current required by the ordinary induction motor. The starting torque is adjustable for lower valves when maximum torque is not required.

Send for Bulletin 210, *giving a full description of these motors for continuous or intermittent loads.*

Safety Provisions Relative to Transmission Machinery--IV.

By W. Sydney Smith

An official report by the Inspector for Dangerous Trades in England, regarding fencing and safety precautions for transmission machinery, has been issued. It explains the structural and administrative safeguards with regard to the several parts of transmission machinery which experience shows to be needed for the protection of persons employed.

THE introductory portion of the present article is a continuation of the **Belt-Perch feature**, and starts off by stating that the design of the bracket (Fig. 18, May 14 issue) can easily be adapted to suit different positions and directions of the driving belts (Fig. 19).

If a pulley be situated close to a bearing, or if two pulleys are close together, modified perches (Figs. 20 and 21) should be fixed to prevent the belt falling between pulley and bearing or between the pulleys,—a frequent cause of accidents and damage to mill-gearing and machinery.

Some form of belt-perch should be used in preference to tying up a belt to the ceiling above the shafting, an operation which often has placed the worker in a position near unfenced shafting, and in many instances has led to fatalities and serious injuries. Whenever any belt repairs are necessary while the

FIG. 21. TYPES OF BELT PERCHES.

shafting is in motion, the belt should never be allowed to come in contact with the shaft, but should rest either on the sleeve fencing the shaft, or on a belt-perch. Portable perches consisting of an inverted trough fixed to the end of a belt-pole are sometimes used, but fixed perches are more satisfactory whenever these are practicable.

Belt Shippers.

A number of appliances, both portable and fixed, have been designed for replacing belts on pulleys from the floor level. For belts not exceeding three inches wide, an ordinary belt-pole may be used, this being a strong, light pole about 1½ inches diameter, carrying at its upper end a wrought-iron pin at right angles to the axis of the pole. The length of the pole should not be less than the height of the shafting above the floor level, there being risk of accident with a short pole as the lower end is liable to be driven forcibly towards the workman. A rigid belt-pole is unsuitable in many cases, and its use may be considerably limited by position, size, length, tension, or direction of the belts, or by obstructions such as pillars, beams and walls. Various types of jointed and flexible belt-poles have been devised to overcome these difficulties; a flexible pole being probably safer to handle than one of the rigid type. When the belts are too heavy or the shafting too high to allow the use of a belt-pole, mechanical belt-shippers enable the belt to be replaced on the driving pulleys from the floor level with perfect safety, without stopping or slowing the transmission machinery.

The earliest type was invented by M. Boudoin, of St. Sauveur-Luxeuil. in 1871, and is said to be in general use throughout the factories in Alsace. This (Fig. 22) consists of an arm or board with beveled edge bolted to a socket which is free to rotate on a fixed sleeve encircling the driving shaft. This sleeve is attached by a bracket to some convenient support adjacent to the pulley. Both socket and sleeve are made in halves screwed together. The fit between sleeve and socket may be adjusted by tightening or slackening the socket screws. The driving shaft rotates freely within the sleeve. The appliance thus forms a belt-perch upon which the belt rests when thrown off the driving pulley, and each pulley must be fitted with one of these appliances. To replace a belt, the wooden arm and socket are turned through an arc of a circle by means of a pole fitted with a hook which engages a small knob near the lower end of the arm; the beveled edge of the arm picks up the belt, allows it to slide on the pulley at the point of intake. and prevents it slipping off the pulley as it travels round the rim.

The type of belt-shipper adopted by the Italian Association for Prevention of Industrial Accidents closely resembles the above, but the lower half of the socket is provided wth two arms nclined at an angle of 60 degs. towards each other and connected at the beveled extremities by a metal band bent to the same curvature as the pulley rim. (Fig. 23.)

There is also a portable Boudoin belt-shipper which may be used for shafts and pulleys varying somewhat in diameter, as shown in Fig. 24. The apparatus is placed adjacent to the pulley and held in position while the belt is replaced in the usual manner by rotat-

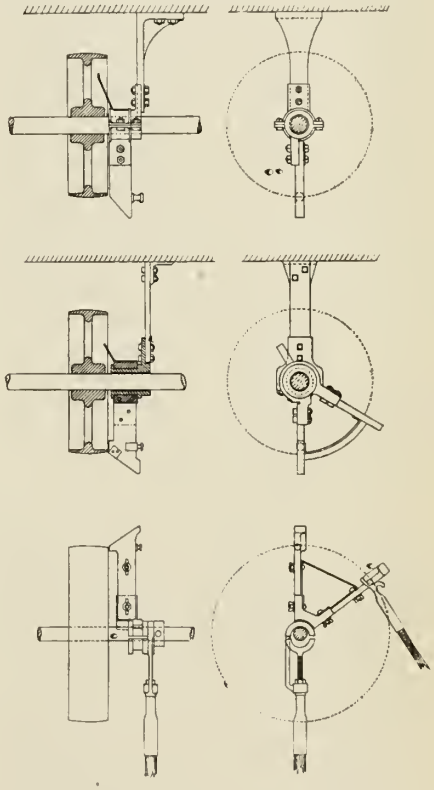

FIG. 22. BELT SHIPPER (BOUDOIN TYPE).
FIG. 23. BELT SHIPPER (ITALIAN TYPE).
FIG. 24. PORTABLE BOUDOIN BELT SHIPPER.

ing the arms with a hook attached to a pole.

The Brancher belt-shipper (Fig. 25), is similar to that of Boudoin, but the supporting bracket and sleeve are omitted; the socket carrying the wooden arm is suspended on the line close to

the pulley, and lateral movement is prevented by a pair of collars screwed to the shaft by counter-sunk screws. The Brancher apparatus and other types may be actuated by means of cords or hand-chains instead of a pole if a light pulley with a v-shaped rim is attached to the socket carrying the belt-shipping arm.

A number of other types have been devised by Continental inventors, and these consist of various arrangements of metal arms adjoining the pulley, and form a belt-perch which carries the unshipped belts. The arms are generally rotated by means of hand chains or cords. An English type of belt-shipper is shown in Fig. 26.

Immediate Stoppage of Transmission Machinery.

Provision should be made in all factories for bringing the shafting quickly to rest in case of breakdown or accidents to workers from transmission machinery. In old installations, electric bells are often considered sufficient for signaling, but these are generally inadequate in case of mishap or accident. Where steam engines are used, more efficient devices are those whereby the engine stop-valve can be directly actuated from any floor or room in a factory, by means of electric push-buttons fixed in a convenient position.

With electric motors for driving the main shafting, it is comparatively easy to arrange in convenient positions, push-buttons to actuate the mainswitch and stop the motor. A powerful electro-magnetic block brake may also be fitted on the line shaft to bring the transmission machinery quickly to rest. If mechanical appliances such as clutches be used, the means for disengaging the transmission machinery should be within convenient reach of the workers.

Oiling and Cleaning.

Such necessary work as oiling and cleaning should be done only by trained and authorized persons; and the oiling of shafting only during stoppage of the transmission machinery, or (if this is not possible owing to special circumstances or the requirements of the manufacturing process) during slow running of the line shafts, unless the transmission machinery is so fenced as to prevent accidental contact with moving parts. Oil cups or lubricators should be fitted on all shaft bearings unless these are of a self-lubricating type. In self-lubricating bearings, the supply of oil or grease will last for weeks or months with little attention, and hence the risk of accident to engineers and greasers is reduced to a minimum.

Lubrication of loose pulleys is not always easy, and if a loose pulley seizes a shaft from want of oil, the machinery may unexpectedly be set in motion and accidents result. The loose pulley is sometimes made slightly less in diameter than the fast pulley in order to lessen the belt tension. Needle lubricators and lubricators of the Stauffer type, or those fitted with a piston and filled with solid grease, are sometimes used. The pulley may ride on a recessed sleeve, secured to the shaft, and be filled with solid lubricant which can reach the inner revolving surface of the pulley boss through holes in the sleeve.

Cleaning and polishing of shafting in motion should never be done with cotton waste, rags or emery cloth held in the hand. Proper appliances should be used, such as long-handled brushes, hooks wrapped round with cord or special clamps with the jaws covered with leather or emery cloth. These can generally be manipulated from the floor level. Rings of metal or leather which hang loosely on the shaft are to be found in some factories. These travel to and fro along the shaft and effectually clean it. They are largely adopted abroad. Many accidents occur between belts and pulleys in motion to workers engaged in treating belts with various compositions to keep them pliant, or in applying resin to slack belts to make them grip the pulleys better. This is a dangerous practice which should not be allowed, unless the transmission machinery is stopped or moved slowly. With a shaft speed of not more than five revolutions per minute, there should be little danger.

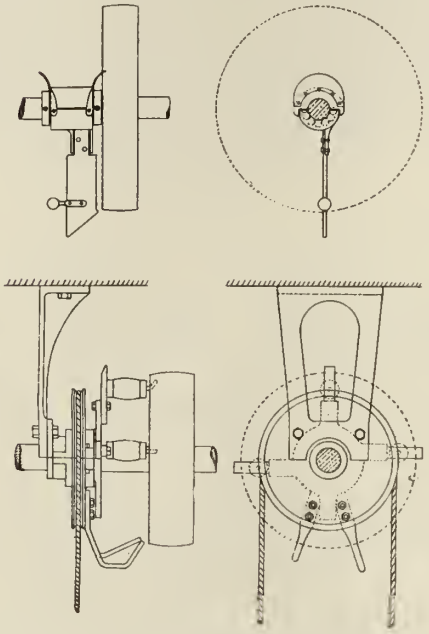

FIG. 25. BELT SHIPPER (BRANCHER TYPE).
FIG. 26. SAFETY BELT SHIPPER (COWLEY'S PATENT).

Ladders for Transmission Machinery.

Suitable non-skid devices are necessary for all ladders used in factories, especially in connection with transmission machinery for manipulating belts, oiling bearings, and other work of maintenance. Shafting ladders are generally fitted with hooks at the upper end, large enough to rest on the shafts. The hooks should be bound with cord.

Many appliances have been devised for preventing slipping at the ladder foot. Iron spikes attached to the bottom of the ladder are common, but these are dangerous where persons are accustomed to work with bare feet. Generally speaking, the form and material of the non-skid device should depend on the kind of floor, iron-shod feet being unsuitable for hard floors such as iron plates, flagstones, brick, tiles, or concrete unless the surface be grooved; in such cases, leather or india-rubber is more satisfactory, though unsuitable for greasy floors. Iron spikes, except as above mentioned, or cast-iron swivel shoes, can be used on soft floors such as wood. Where a ladder is required to be reared at different inclinations, swivel feet are the most satisfactory.

NATIONAL SUPPLY AND MACHINERY DEALERS' CONVENTION.

THE programme for the ninth annual convention of the National Supply and Machinery Dealers' Association, which meets in conjunction with the American Supply and Machinery Manufacturers' Association at White Sulphur Springs, W. Va., June 15, 16 and 17, is briefly as follows:

Monday, June 15, 10.30 a.m.—Open session. Annual address of President Charles S. Farquhar, Chandler & Farquhar Co., Boston, Mass.; reports of Secretary-Treasurer Thomas A. Fernley, and of the executive committee.

Monday, 2.30 p.m.—Joint session with the American Supply and Machinery Manufacturers' Association; addresses by well known speakers on topics of national importance to dealers and manufacturers.

Tuesday, June 16, 10 a.m.—Executive session. Report of the treasurer and of the committee on the cost of distributing mill supplies and discussions on cash discounts, association work, direct shipments, stock and cost records, standardization of records and other subjects of interest to machinery dealers.

Wednesday, June 17, 10.30 a.m.—Executive session. New business, election and installation of officers, expressions of preference regarding place of next convention, final adjournment of business sessions.

On Tuesday afternoon there will be no session of either body, which will allow time for private conferences on matters of individual business concern

Modern Transportation--The Electric Truck

By D. Watson

The author of this article not only makes emphatic declaration of the increased efficiency and economy resulting where gasoline and electric motor trucks have superseded horse traction, but unhestitatingly expresses the opinion that the electric vehicle is in turn away ahead of that of its gasoline companion, in many respects for general delivery service.

ONE of the great problems of modern business is the continually increasing costs and decreasing profits. Particularly are these conditions to be met with in manufacturing plants. Wage costs increase, material costs follow, and the plant executive are facing the problem of how to make profits with increasing costs of manufacture, increasing costs of sales and of distribution, and without correspondingly increased returns from higher selling price. The successful business is meeting this condition by increased efficiency.

Among the most inefficient branches of the modern business, is the transportation system. Very little attention is paid to the delivery costs. Few merchants have any accurate idea of what it is costing them to deliver their goods, or how much time and money are wasted by inefficient methods and organization. Evidence of this is found, when attempts are made to gather data as to the cost of horse delivery of merchandise and parcels in our larger cities. Inquiries reveal the fact that costs are not properly separated, and figures are merely estimates, more or less vague. The continual climb in the percentage of cost of carrying on business has compelled attention to this phase of business, as well as others, and executives are beginning to give the matter careful attention, with the natural result that methods of reducing these costs are now looked for.

Motor Truck Transportation.

The rapid and continual rise in the price of horses and of feed, and the loss of time due to congestion of traffic, as our cities grow, has turned attention to motor transport, to motor wagons and trucks. The modern motor truck is no experiment. To think of it as still in the experimental stage, or as simply a pleasure car adapted to commercial needs, is to do it an injustice. The motor truck is the product of the age of modern inventive genius and financial faith; a wage earner like the rest of us, doomed as we are to face the test of character and adaptability. The motor truck is here because the twentieth century needs it.

The motor truck falls naturally into two general classes, distinguished by its power supply, gasoline or electric. Each has its own particular field, and the question of which type to adopt, if any, to replace horse delivery, is purely a question of the class of service it is to supply, and the cost of performing that service. There are other considerations also, that are seldom considered, and yet are daily becoming increasingly important:—viz., those of street cleanliness, traffic congestion and time lost incident to delays caused thereby.

More Economical Than Horse Transport.

Both types of vehicle, gasoline and electric, can show considerable economies over the horse, besides having the very important ability to meet successfully sudden and extraordinary demands for overwork, during rush periods.

On long-haul, non-stop runs of considerable distance, where high speed is required to cover the trip in a given time, the gasoline truck has its advantages. On the other hand it costs more to operate and maintain, and its life is much shorter than the electric of corresponding capacity.

The electric truck has unquestionably demonstrated its superiority in city trucking, transfers and deliveries, and upwards of 80 per cent. of delivery work is just such service. In the larger cities of the United States, in the great haulage centres, the electric predominates, and by far the larger percentage of commercial vehicle fleets are electric. There are many reasons for this, and it would be wise, probably, to look into these with some detail.

Predominance of Electric Trucks.

The electric is more economical than either the horse or the gasoline truck for concentrated city service. It requires no expert chauffeur to operate, while it takes a man born, as the saying is "with a monkey wrench in his hand," and some experiences as an all-round machinist, to keep a gasoline truck on the road. Naturally, men of this calibre want, and get, very high wages. Add to this the high cost of upkeep in tires, repairs, etc., to say nothing of the much higher cost of fuel, and the 20 per cent. annual depreciation, and it makes the gasoline truck an expensive method of transportation.

On the other hand, a couple of days' instruction by a competent demonstrator, will enable the average teamster to successfully operate an electric truck, That is, he will be able to take it around corners without taking the lamp-post with him, back it into alleys and doorways, go down grades at a safe pace, and so on. In a few days he is absolute master of it. In fact, in changing from horses to electric trucks, the regular horse drivers can be utilized, which does much to simplify the problem, as they often possess a valuable knowledge of the delivery routes and methods, and of the firm's customers. Again, most drivers are not only willing, but anxious, to learn to handle the electric. Over two million dollars' worth of electric trucks, in one industry alone, are being driven by ex-teamsters, with great success. Another item of economy in the electric truck is the saving in ground rent, made possible by the smaller housing space required for it. In the present phenomenal increase in real estate values and taxes, this has come to be a matter of great importance. To give just one instance:

In 1906, the Peter Doelger brewery in New York, had over 200 horses, of the best in the country. The horse stables, harness, and wagon rooms, occupied a space 305 feet by 350 feet. These have all been replaced with electric trucks. In addition to the actual saving in delivery of their goods, an immense saving has been made in real estate investment. A fine electric garage has been built 85 feet x 100 feet, with four floors having a capacity of 96 trucks, making a saving of 28 city lots, valued at $560,000. The space saved is now devoted to a new bottling plant and shipping room. Allowance has been made in the garage for future expansion of business, as 52 trucks are doing all the work of the previous horse equipment.

This company found it was costing them 15 cents per barrel for delivery within an eight-mile radius, as against 35 cents per barrel with horses and, with improved methods of handling made possible by the motor truck, it is expected to reduce this to 12½ cents. Their superintendent reports the saving in 1912, due to modern electric delivery equipment, to be $80,000.

Due to its simplicity and fewer parts, the electric truck is much more dependable. There are no reciprocating parts—no cylinder, carburetor, magneto, clutch, transmission, or cooling system troubles, for it has none of these trouble-makers in its system. No damage by frost in winter time, for it has no water circulation to freeze. The entire power plant consists of four items — motor, silent chain, countershaft and roller-chain drive. A look at the chassis of the two systems will reveal this to the most casual glance; three moving parts as against dozens. This item of dependa-

bility, of always being "on the job" when required, of running day after day, without expensive lay-ups for repairs and replacements, is one of the strongest points of the electric. Scores of electric trucks in daily service to-day are from eight to ten years old, and while not so efficient as their more modern brother, are still far too valuable to be scrapped.

DECARBURIZATION IN HARDENING STEEL DIES.

THE following note was contributed to the London meeting of the Iron and Steel Institute, May 7 and 8, by Dr. H. C. Greenwood:

"In some preliminary trials of an electric muffle for hardening steel dies, the steel (containing about 1 per cent. of carbon and 1 per cent. of chromium) was allowed to soak at 820 degrees C. for an unnecessarily long time—namely, about one and a half hours—in order to make quite sure of uniformity of temperature. The working face of the die was protected against scaling by a sheet-iron cover filled with powdered charcoal. On removal from the furnace the cover was knocked off, the face brushed free from charcoal and the block quenched under a spray.

Curiously enough the working face, which had ben in contact with charcoal during the heating, was found to be superficially soft, while all the other parts of the die (which, by the way, had a less sudden cooling) were perfectly hard. The surface could be filed to a depth of about half a millimeter, below which the steel was glass hard. This behaviour was not confied to a single instance, but was observed in all cases where the surface was protected in this way. If the face were left bare the surface was perfectly hard, but somewhat pitted by oxidation. This difficulty was, however, overcome by using some inert powder, such as fine sand, instead of charcoal, to cover the surface, no diminuation of the hardness being effected.

It only remained to seek an explanation of the paradoxical action of the charcoal in softening the surface layer. Some test-slices of the steel were accordingly taken and heated under the same conditions, packed in charcoal, for about one and a half hours, while similar strips, unprotected in any way, were heated alongside. All were quenched together, and, after annealing at 600 degrees, and cleaning with emery, the respective surfaces were planed off (taking a very light cut) and combustions made of the planings. This procedure was repeated, changing round the specimens after machining of ⅛ in. from each surface. The analyses gave the following results in carbon per cent., for experiments I and II respectively:

	I.	II.
Specimens pro. by charc'l ..	0.38	0.59
Specimens unpro. by charc'l.	1.08	0.87

It is clear from these results that a decarburization of the surfaces in contact with carbon had been effected, and this is confirmed by the fact that the soft skin persists in rehardening. Why such an action should take place is, however, not very obvious, and the main reason for publishing this note is to ascertain if any similar effects have been observed by others.

LOW PRESSURE BOILER EXPLOSIONS.

MANY steam users are under the impression that, when boilers or vessels to which steam is admitted for heating and boiling purposes are worked at low pressure, failure cannot produce serious results, though experience often shows this assumption to be untrue. In the early days of steam many terrible boiler explosions occurred, although boilers were then of a primitive type, and pressures used only a few pounds per sq. inch, which is insignificant as compared with modern practice. In the event, however, of the sudden rupture of a large boiler, even when working at low pressure, the amount of energy liberated is capable of doing great damage.

In the May issue of the Vulcan is an illustration taken from the Illustrated London News for December 27th, 1845, showing the havoc wrought by the bursting of a wagon boiler at a cotton mill at Bolton. The boiler was of a type which was incapable of resisting a high pressure, and though the actual working load is not stated in the brief account of the disaster, it seldom exceeded 12 lb. to 15 lb. on the inch. All the same, it sufficed, as the illustration shows, suddenly to convert a large part of a four-storied mill into a heap of ruins and kill ten workpeople, while nine others were more or less seriously injured.

Sir Joseph Wilson Swan, inventor of the original incandescent electric lamp, died on May 27. He was 86 years old, and was born in Sunderland, England. Sir Joseph spent many years of his life in experimenting with electric lamps, and in 1879 succeeded in solving the problem of producing an incandescent light, and thus making possible the general use of electricity for lighting purposes. He was the inventor of many other electrical devices, including a miner's safety lamp and an electric meter. He also made many improvements in accumulators.

MATERIALS OF CONSTRUCTION.

PROFESSOR E. HEYN, Berlin, Germany, in the course of a lecture delivered by him on May 12 before the Institution of Mechanical Engineers, said that it was a well-known fact that the welfare and convenience of modern mankind was, to a very considerable extent, influenced by the achievements of the engineer. People admired his work and were daily confiding life and health to his creations, but only a few were conscious of the fact that engineering work was, to a great amount, dependent on the possibility of manufacturing sound materials fit for the purpose, and of keeping them sound in the course of the manifold processes that these materials required to go through until they were assembled into the admirable engineering structures presenting themselves to the public eye. Few persons were conscious of the enormous amount of thought bestowed on the question of soundness of materials by thousands of men fighting continuous struggles against the numerous hidden dangers involved in the intricacy of structural material, and working strenuously towards its perfection and reliability.

Certain structural members might fail even without being subjected to stresses in service. For instance, it had often been observed that condenser tubes made out of brass cracked simply when stored up in the yard. Some articles made out of this metal, when exposed to atmospheric influences, underwent an alteration to such an extent that they might be crumbled between the fingers. Similar phenomena could be stated in structural members made out of other metals and alloys, when they were manufactured under unfavorable conditions, which lead to serious internal strains.

The author said that he had made a special study of the phenomena connected with internal strains, investigating their causes and devising a method for measuring their amount, and in the course of the lecture he dealt specially with the internal strains produced by cold working of metals (cold drawing, cold rolling, cold hammering, etc.). He showed that, by these operations under unfavorable conditions, internal strains might be set up in structural members which came close to their resisting power, so that even trifling additional strains caused by external forces or other circumstances (scratching of the surface, unequal heating or cooling, slight corrosion by certain agents which were contained in the atmosphere or by certain paints) might lead to unforeseen fracture. He discussed the means for removing or diminishing such dangerous internal strains, and illustrated his lecture by numerous samples taken from the domain of practical engineering.

The Effect of Electrical Engineering on Modern Industry *

By Charles P. Steinmetz **

In Section I. of the accompanying article, energy in chemical and electrical form is discussed and comparisons made, while in Section II. the part that distribution of materials and energy play in our civilization is treated also from the comparative achievement standpoint of chemical and electrical energy.

THE use of electricity in modern civilized life is rapidly increasing: in lighting our homes, factories, streets; in industrial power applications; in domestic service, from the fan motor to the electric bell or the heating and cooking device; in transportation: and while no great inroads have yet been made into the field of the steam locomotive, an entire system of electric railroads has sprung up all over the country, fully comparable in size and power demand with the steam railway system; large new industries have developed in electro-chemistry and electro-metallurgy, supplying us with materials unavailable before—as aluminum—or improving the production of other materials—as in copper refining, etc.

All these applications are uses of energy, and in nearly all electrical energy is replacing some other form of energy used heretofore: chemical energy of fuel, or mechanical energy of steam or gas engines, etc. To understand the reasons which enable electrical energy to compete successfully with other forms of energy, which are longer and more familiarly known, we have to look into its characteristics.

Electrical Energy Characteristics.

Electrical energy can be transported—or, as we usually call it, transmitted—economically over practically any distance. Mechanical energy can be transmitted over a limited distance only, by belt or rope drive, by compressed air, etc.; heat energy may be carried from a central steam heating plant for some hundred feet with moderate efficiency, but there are only two forms of energy which can be transmitted over practically any distance, that is, which in the distance of transmission are limited only by the economical consideration of a source of energy nearer at hand: electrical energy, and the chemical energy of fuel. These two forms of energy are the only competitors whenever energy is required at a place distant from any of Nature's stores.

Thus, when we study a problem in electric power transmission and consider whether it is more economical to transmit power electrically from the water power or the coal mine, or to generate the power by a steam plant at the place of demand, both really are transmission problems; and the question is whether it is more economical to carry energy electrically over the transmission line, or to carry it chemically, as coal by the railroad train or boat, from the source of energy supply to the place of energy demand, where the energy is converted into the form required, as into mechanical energy by the electric motor or by steam boiler and engine or turbine.

Electrical and Chemical Energy Compared.

Electrical energy and chemical energy both share the simplicity and economy of transmission or transportation, but electrical energy is vastly superior in the ease, simplicity, and efficiency of conversion into any other form of energy, while the conversion of the chemical energy of fuel into other forms of energy is difficult, requiring complicated plants and skilled attendants, and is so limited in efficiency as to make the chemical energy of fuel unavailable for all but very restricted uses—heating, and the big, high-power steam plant.

Pressing the button turns on the electric light and thereby starts conversion into radiating energy: with chemical energy as source, either special fuels are required—in the candle, kerosene lamp—or a complex gas plant. Closing the switch starts the motor, whether a small fan motor or a 1,000-horse power motor supplying the water system of a city or driving the railroad train. With fuel as the source of energy, the boiler plant, the steam engine, or turbine, with their numerous auxiliaries, and skilled attendants, etc., are necessary, and the efficiency is low except in very large units.

To appreciate the complexity of the conversion of the chemical energy of fuel, compared with the simplicity of electrical energy conversion, imagine the domestic fan motor with coal as the source of energy. We have a small steam engine, with boiler and furnace, attached to the fan, and to start the latter we have to make a coal fire and raise steam to drive the engine. This illustrates how utterly unavailable the chemical energy of fuel is for general energy distribution. General energy distribution, therefore, may justly be said to date from the introduction of electric power.

Equally true is the reverse: the conversion of mechanical or other energy into electrical is simple and economical, while the conversion into chemical energy is not. Hence, one of the two large sources of Nature's energy, the water power, was, before the days of electrical engineering, useless except to a very limited extent, since the location of the water power is rarely such that the energy could be used at its source. The water powers thus have really been made available only by the development of electrical transmission.

Density Concentration of Electrical Energy.

It is a characteristic of electrical energy that it can be concentrated to an energy density higher than any other form of energy, and results can thus be produced by it which no other form of energy can bring about, or do directly by the brute force of energy, as we may say, which formerly had to be brought about in a roundabout way.

Thus iron can be reduced from its ores by the chemical energy of coal in the blast furnace, but aluminium and calcium can not, as their chemical affinity is higher, and require the higher energy concentration available with electric power. Iron reduced in the blast furnace combines with carbon to cast iron, so calcium combines with carbon in the electric furnace to carbide, the starting material of acetylene, and of cyanamid and the modern fertilizer industry. Platinum can just be melted, and quartz softened, in the hottest flames of combustion—the oxy-acetylene flame and the oxy-hydrogen flame; but, in the electric arc, platinum and quartz and every existing substance, even tungsten and carbon, can be melted and distilled or sublimed. Accordingly, mighty industries have grown up and many new materials made available to man, as aluminum, silicon, calcium, chromium, the carbides, cyanamid, acetylene, etc., while others are produced in a cheaper manner, as alkalies, hypochlorites, phosphorus, magnesium, sodium, etc.

Electricity as such is the most useless form of energy: it is not found in Nature in industrially available quantities, and finds no industrial use as electrical energy, but it is always produced from some other form of energy, and converted into some other form of energy: light, mechanical energy, chemical energy, heat, etc. That is, electrical energy is entirely the connecting link,

*From the Journal of the Franklin Institute.
**Chief Consulting Engineers, General Electric Co.

the intermediary, by which energy is brought from the place where it is found to the place where it is used, or changed from the form in which it is found to the form in which it is used.

Thus, on first sight, it appears a roundabout way, when, for instance, in modern electrical ship propulsion an electric generator is placed on the steam turbine, and a motor on the ship propeller, a few feet away, though it is not different from practically every other use of electric energy: a transmission link, superior to any other transmission by the flexibility given by the simplicity and economy of conversion.

Electrical Energy Storage.

The most serious disadvantage of electrical energy is that it can not be stored. It is true there exists the electric storage battery, and it is used to a large extent as a stand-by battery in high-grade electric distribution systems to give absolute reliability of service, or as a battery floating on a railway circuit to equalize fluctuations of power, or in special applications, as electric automobiles. It does not really store electrical energy, but stores energy by conversion of the electrical into chemical energy, and by reconversion, in discharge, of the chemical into electrical energy.

The economic efficiency of the storage battery—using the term in the broad sense, including interest on the plant investment and depreciation—is so low that the storage battery does not come into consideration in the industrial storage of energy—that is, in making the rate of electrical energy consumption independent of that of energy production. We can best realize this by comparing electrical energy with the chemical energy of fuel; the latter can be stored with perfect economy.

Thus, when using fuel as the source of energy—in a steam plant—no serious difficulty is met by the industry even if the fuel supply is interrupted for months, as in the case of a supply by water, through the closing of the navigation by ice. We would simply bring in a sufficient coal supply to last until the navigation opens again in spring; but with electrical energy from a water power we could never dream of storing energy by storage battery to last over the two or three months during which the river runs dry and the water power fails.

Electrical Energy Cost Feature.

This means that electrical energy must be consumed at the rate at which it is produced, and the cost of electrical energy thereby becomes dependent on the rate of the energy used. This is not the case with most other forms of energy, as, for instance, the chemical energy of fuel. The price of a ton of coal, as determined by the cost of supplying it, is the same whether I dump the coal into a furnace all at once, or whether I use it up at a uniform rate in a small stove, lasting for weeks.

If I consume 2,400 cubic feet of gas per day, its cost and thereby its price is the same whether I use the gas at a uniform rate throughout the day, or 100 cubic feet per hour, or whether I use the entire 2,400 cubic feet in one hour and nothing in the remaining twenty-three hours. The gas is produced at whatever rate is most economical, stored in the gas holders, and supplied from there at whatever rate it is required for consumption. If, however, I use 240 kilowatt-hours of electrical energy per day, it makes a very great difference in the cost of supplying this energy whether I use it at a uniform rate of 10 kilowatt-hours per hour, or whether I use the entire 240 kilowatt-hours in one hour and nothing in the remaining twenty-three hours.

In the former case, 10 kilowatts of generating machinery are necessary in the steam or hydraulic station producing the electric energy, 10 kilowatts capacity in transmission lines, transformers, substation and distribution lines, to supply the demand. In the latter case, 240 kilowatts of generating machinery, 240 kilowatts of line and transformer capacity are absorbed, and that part of the cost of supplying the electric energy, which consists of interest in investment in the plant, of depreciation, etc.—in short, the fixed cost—is twenty-four times as high in the latter as in the former case.

If the fixed cost approximates half the total cost in a steam plant, or is by far the largest part of the total cost in a hydraulic plant, it follows that in the case of concentrated energy used during a short time the cost of electric energy—and with it the price—will be very much larger—many times, possibly—as in the case of a uniform energy consumption.

Thus, due to the absence of storage, the cost of electrical energy essentially depends on the uniformity of the rate of its use—that is, on the load factor, or the ratio of the average consumption to the maximum consumption.

If I use 240 kilowatt-hours of electrical energy in one hour, and nothing during the remaining twenty-three hours, that part of the cost which is the fixed cost of plant investment and depreciation is twenty-four times as great as if I used the same amount of energy at a uniform rate throughout the day. In the former case, if somebody else uses 240 kilowatt-hours, but during another hour of the day, the same plant supplies his energy, and the fixed cost thus is cut practically in two—that is, the cost of energy to both of us is materially reduced.

Thus, again, the cost of electrical energy, and with it its price, depends on the overlap or non-overlap of the use of the energy by different users, the so-called "diversity factor." The greater the diversity factor—that is, the less the different uses overlap and the more their combination, therefore, increases the uniformity of the total energy demand, the "station load factor"—the lower is the energy cost. The cost of electrical energy for lighting, where all the demand comes during the same part of the day, is inherently much higher than the cost for uniform twenty-hour hour service in chemical works, and with the increasing variety of load, with the combination of energy supply for all industrial and domestic purposes, the cost of energy decreases.

Unlike other forms of energy, due to the absence of energy storage, electrical energy can therefore have no definite cost of production, but, even supplied from the same generating station, its cost varies over a wide range, depending on the load factor of the individual use and the diversity factor of the different uses. This feature, of necessity, must dominate the economical use of electrical energy in industrial, domestic, and transportation service.

HOW BOXES ARE MADE BY MACHINERY.

By W. J. Horner.

BOXES are simple things to construct, but nevertheless it does not pay to make them by hand in quantity. It does not matter what their size, shape, or character, may be; whether neatly finished with dovetailed corners, or rough packing cases nailed together; there are machines for making them which will do the work much quicker and at least as well as the most skilful man could do it.

In the construction of a box there are a number of totally different operations to be performed, and each one of these operations requires a special machine. Men or boys are necessary for taking the material from one machine and presenting it to another, but otherwise no hand work is done. Most people are aware that an ordinary sawmill is equipped with machines for sawing and planing wood, and that these machines can be set if required to saw and plane any number of pieces to a particular size, but, in addition to these, a number of special machines are used for box and packing case work.

The Nailing Machine.

The most important and most wonderful of these is the nailing machine. This is as great a time saver compared

with the hand hammer as a circular or band saw is to a hand saw. The nailing machine has superseded the hammer to such an extent in box factories as to make the latter an almost obsolete tool. Instead of two or three blows with a hand hammer on a nail, with the possibility of its not going straight and having to be withdrawn, one stroke only of the machine drives the nail completely home, straight and just where it is wanted. Driving one nail at a time, however, is the slowest work the machine can do. Usually either one line or two lines of nails are all driven simultaneously at a stroke. The machines are constructed with a line of nail-holders and punches above them for forcing the nails down into the wood, and any one or more of these nail holders and punches can be thrown out of operation when the full set are not required.

Nailing machines vary in size, capacity, and design, according to the work required of them, but in all cases they have a table on which the work rests, a series of nail holders above this, and hoppers above these for containing the nail supply. From the hoppers the nails slip down automatically one at a time into the holder or chuck, and are there held upright for driving. The height of the chucks above the table has to be adjustable to suit the work. Adjustable fences are required against which the pieces of wood on edge on the table are pressed to bring them in exact position for receiving the nails in the centre of their thickness.

For nailing the sides and ends of a box together a machine driving a single row of nails at a time is all that can be used advantageously, the box being turned by hand to bring each corner under the nails in turn. For nailing on bottoms, machines with two lines of chucks at right angles to each other are often employed, so that a side and end are nailed simultaneously. Other machines without fences are used for nailing cleats on the sides, ends, bottoms or covers of boxes. These usually drive two lines, or a zigzag arrangement of nails along the cleat, and clinch them also. The clinching is done by having a slot in the table below the line of nail chucks which permits the nail points to come through the wood. The punches are then kept down tight on the nail heads while a hard steel bar fitting in the slot is forced up level with the table surface, thus bending the nail points over and burying them in the wood. In all nailing machines, the driving of nails is controlled by a foot lever, so leaving the hands free for holding the wood in position on the table.

Production of Box Parts.

Lock corners and dovetails are always cut by machines, and this work is further expedited by cutting a number of ends together, the boards being put on the machine in a pile. Boxes jointed in this way are usually glued only. Sometimes they are merely forced together a tight fit without glue. Bottoms are always put on with nails. Setting-up machines are used for putting the boxes together, and these insure them being square, besides saving time and troublesome work. The four pieces which form a box are placed and gripped each in a separate pair of jaws which are arranged in a quadrangle and move inwards towards each other when a foot lever is pressed. Great power is obtained in this way for squeezing the joints together. If glue be used, the ends of the wood are dipped in glue before putting them in the machine.

When planed wood is used, the outsides of the boxes often require trimming at the joints after the parts are together. Special machines of the planer type are employed to do this. Very often small boxes are glasspapered also. For this purpose, ordinary glasspapering machines, generally of revolving disk type, are used. Machines are also employed for making and inserting wire hinges in hinged cover boxes. Designs in ink printed on the wood are done by machine before the boxes are put together. Soda water boxes have wire or hoop-iron straps put on, and the hand holes cut in the ends by machines designed for the purpose.

The manufacture of cardboard boxes is a larger industry than that of wood boxes, and the varieties of machines employed for the purpose are more numerous. These are mostly for cutting, flanging or bending, and pasting. The manufacture of tin boxes is also a large industry. In this the machines mostly used are for cutting, pressing, and stamping. The time occupied is so little that the value of a box is scarcely any more than that of its material.

COMING CONVENTIONS.

Master Car Builders.—Atlantic City, June 10. Joseph W. Taylor, secretary, Karpen building, Chicago.

Railway Electrical Engineers.—Atlantic City, June 10. J. A. Audreucetti, secretary-treasurer, C. & N. W. Ry., Chicago.

Railway Supply Manufacturers' Association.—Atlantic City, June 10-17. J. D. Conway, secretary, 630 Oliver building, Pittsburgh.

American Society of Mechanical Engineers.—June 16-19, Minneapolis (headquarters at University of Minnesota). Calvin W. Rice, secretary, 29 West Thirty-ninth street, New York.

American Institute of Chemical Engineers.—Troy, N.Y., June 17-20. J. C. Olsen, secretary, Brooklyn Polytechnic Institute, Brooklyn, N.Y.

Railway Master Mechanics.—Atlantic City, June 15-17. Joseph W. Taylor, secretary, Karpen building, Chicago.

American Society for Testing Materials.—Atlantic City, June 30-July 4 (headquarters Hotel Traymore). Prof. Edgar Marburg, secretary, University of Pennsylvania, Philadelphia, Pa.

Railway Tool Foremen's Association. — Chicago, July 20-22. A. R. Davis, secretary-treasurer, 730 Pine street, Macon, Ga.

Railroad Master Blacksmiths. — Milwaukee, August 18-20. A. L. Woodward, secretary, C., H. & D. Railway, Lima, O.

American Foundrymen's Association. — Chicago, September 7-10 (headquarters Hotel LaSalle). A. O. Backert, secretary, Penton building, Cleveland.

Railway Bridge and Building Association. — Los Angeles, October 20-22. C. A. Lichty, secretary, C. & N. W. Railway, Chicago.

Bridge and Building Supply Men's Association.—Los Angeles, October 20-22. H. A. Nealy, secretary, Joseph Dixon Crucible Company, Boston.

Railway Electrical Manufacturers' Supply Association. — Chicago, October. J. Scribner, 1010 Monadnock building, Chicago.

Replacing Belts on Pulleys.—A number of appliances, both portable and fixed, have been designed for replacing belts on pulleys from the floor level. For belts not exceeding 3 in. wide, states the writer of an article in Vulcan, an ordinary belt pole may be used. This is a strong, light pole about 1½ in. diameter, carrying at its upper end a wrought iron pin at right angles to the axis of the pole. The length of the pole should not be less than the height of the shafting above the floor level. There is risk of accident with a short pole, as the lower end is liable to be driven forcibly towards the workman. A rigid belt pole is unsuitable in many cases, and its use may be considerably limited by position, size, length, tension, or direction of the belts, or by such obstructions as pillars, beams, and walls. Various types of jointed and flexible belt poles have been devised to overcome these difficulties; a flexible pole is probably safer to handle than one of the rigid type. When the belts are too heavy or the shafting too high to allow the use of a belt pole, mechanical belt shippers enable the belt to be replaced on the driving pulleys from the floor level with perfect safety, without stopping or slowing the transmission machinery.

Blue Print Reproduction.—The making of a blue print from a blue print is described by a correspondent of the Concrete Record as follows: — To obtain good results, a clear, sharp, and rather dark print is essential, for if it be blurred or light it will not reproduce satisfactorily. The method consists of coating the print with a little kerosene and then printing immediately. The oil used will not affect the reproduction of the new print, unless it is applied very thickly, nor will it spoil the original, as the oil soon dries, leaving the print in as good condition as before. This process, it is stated, will also work perfectly when it is desired to make prints from heavy drawings. It has been used with success to make blue prints from printed matter. To make the original perfectly transparent, a coat of boiling hot paraffin is applied.

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

PLATE LAY-OUT.

By Joseph W. Ross.

IN these articles on plate lay-out an endeavor will be made to explain the general principles without technical verbiage likely to confuse the uninitiated. It is desired to help out the young mechanic, who does not care to give the time necessary to the study of geometry and projection, required in some of the problems that occur in the developing of sheet iron and also heavy plate. The student is strongly advised to practise in his spare time the exercises which will be explained and illustrated from time to time.

It is not necessary to have an elaborate drawing outfit; a pair of compasses, rule, pencil, and some drawing paper will be quite ample to begin with. Making models on stout paper of the problems set forth is highly recommended for practice, so that the student may familiarize himself with the general shapes and forms. He will thus be able to grasp the subject more readily. Plane or flat surfaces, cylindrical, conical and irregular curved surfaces will each be dealt with and illustrated by a few general examples.

The Tools Feature.

A few words about the tools will not be out of place at this stage, although no doubt everyone is more or less familiar with them. Trammel points, or trams, is a device with two separate steel points fitted to two metal blocks. These blocks have slots, through which runs easily a rectangular rod of iron or hardwood. A knurled screw permits the trams to be clamped at any desired distance apart. The trams are used for circumscribing large circles and arcs, and for dividing and subdividing lengths. The dividers are for spacing rivet holes and also for drawing small circles.

The measuring wheel is an instrument for measuring curved lines. It is a flat circular disk, beveled at its edge, and pivoted at the centre to a handle. The circumference of the wheel is generally made to a standard of 2 feet or 3 feet, with inches and parts of inches graduated on its edge.

All points of identification and locations should be lightly centre punched, while short straight lines are drawn in with a straight-edge of seasoned hardwood or with a length of steel, planed straight. Long straight lines are marked on the sheet by snapping in with a chalk line. This is a length of fine string or cord (a fishing line makes an excellent chalk line) covered with chalk by rubbing the chalk over the cord. The line is drawn taut and held at each end of the plate; the cord being then raised at the centre a few inches and allowed to snap back to the plate, leaving a fine clear straight line if the operation is performed correctly.

Squaring the Plate.

The first and most important operation in plate lay-out is the "squaring up" of the plate. By "squaring up" is meant making the four edges of the plate conform to a perfect rectangle; that is, having its opposite sides parallel and its angles right angles. Small plates may be readily squared with an ordinary two-foot steel square. For squaring up large plates, the method of procedure is as follows:—

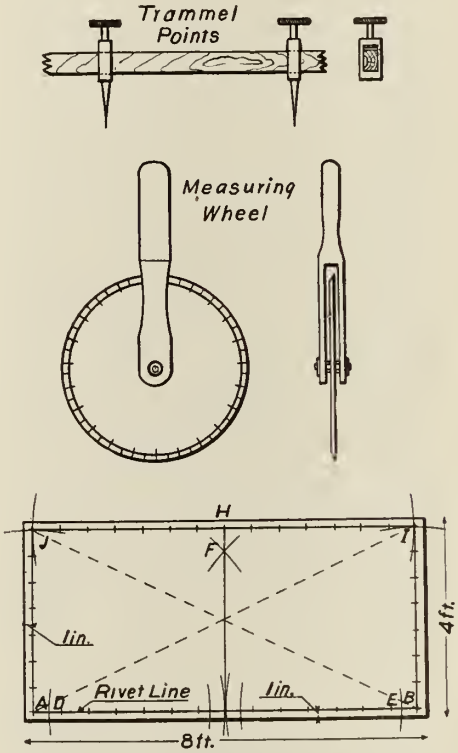

FIG. 1. PLATE LAY-OUT.

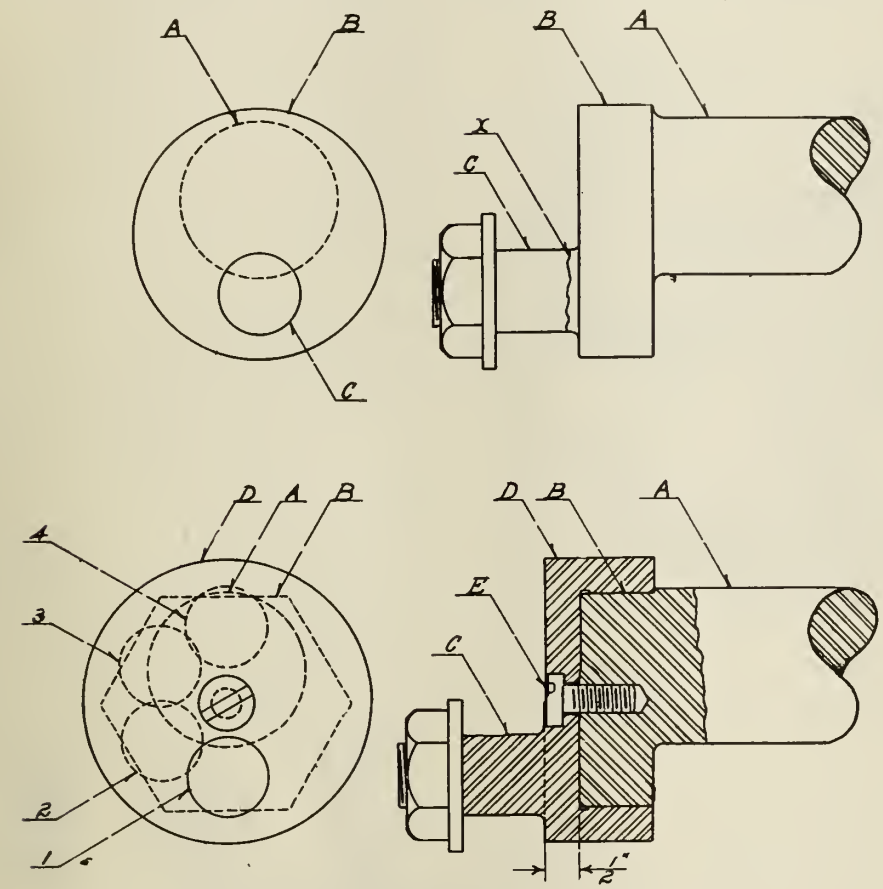
Assume that the squared plate is to be 8 ft. x 4 ft. and the line of rivet holes is 1 inch from the edges. Measure 1 inch from the edge of the plate as shown in Fig. 1 at AB, connect these two points by snapping in a straight line with a chalk line. Then with the trams at centres A and B respectively, and with a trial radius equal to about half the length of AB, strike the arcs as shown, reset the trams to half the distance between the trial arcs, and strike the arcs again; this second trial will most likely give the exact centre of the line AB. With centre C and with any radius strike the arcs DE, and with the same radius, or larger, as the case may be, and with centres D and E, strike the intersecting arcs at F. Let F be struck near the top of the plate, as this gives greater accuracy. Connect C to F by a straight line.

The line CF is now at right angles to the line AB and equidistant from the points AB. Mark off on the line CF a distance equal to 4 feet less 2 inches, as this is the line of the rivet holes at the top of the plate. With the trams set to this distance, place the points on A and B respectively, and strike the arcs J and I. With the radius AC or CB (which are equal), and with H as centre, strike the arcs cutting at I and J. Connect by straight lines J to I, J. to A, and I to B. If the work has been accurately done, the diagonal distance J to B is equal to I to A. Mark off 1 inch from these lines for the edges of the plate. This completes the squaring up. The rivets are stepped off with the dividers along each line. For stepping off the holes the dividers are set to a trial distance, and if it does not space out correctly to the desired number of holes, the dividers are reset or adjusted for another trial until the spaces are equal.

The reader may think there is an unnecessary amount of work to obtain the squaring up of the plate; but it is absolutely necessary for this method to be followed to obtain good results, and it is the best practical as well as geometrical method of obtaining this result. It is the method adopted by all first-class workers, and is not so difficult as it may appear at first glance to the learner. The interested reader is strongly advised to practise this exercise on paper in his spare time, as a few trials will quickly enable him to memorize the method.

In the absence of the regular trammel points, rough and ready improvised trams may be constructed out of a light wooden batten, through which a couple of nails can be driven to act as the points.



Alexander Armstrong died at his home in St. Thomas, Ont., on May 24, after a long illness. Mr. Armstrong conducted on iron foundry in St. Thomas for many years.

REPAIRING A BROKEN CRANK SHAFT.

By J. H. Rodgers.

THE accompanying sketch shows the repairs made on a small slotting machine crank shaft. The collar B on the crank shaft was milled to a hexagon shape, the piece D being made to fit, and secured by means of the screw E.

FIGS. 1 AND 2. REPAIRING A BROKEN CRANKSHAFT.

The original crank, as shown in Fig. 1, had a permanent stroke of 3 inches, while the repair made possible four different strokes—1¼ in., 2 in., 3 in., and 3½ in., a great convenience on certain work.

Although not as rigid as the solid crank, the repair was very satisfactory.

MODERN SCIENTIFIC SELLING.

By D. A. Hampson.

I DROPPED into Scotty's the other night to get a spring haircut. You know Scotty and I were chums as boys, and Scotty is as crazy to "barb" as I am to run a lathe. Quite naturally he made a good barber, and he was a first-class man with the edge tools of his profession—no saw-tooth razors or hair pulling shears in his sets.

As he dexterously clipped on the two months' growth, he talked. "How do you like the feel of these shears?" he said.

"Fine as always," I replied.

"Well, I notice a difference, even if you don't; they are sharpened a new and a better way. You know I sharpened my shears on that little motor grinder in the back room, used a very fine steel, and stoned them up a little by hand. That gave my blades a perfectly smooth, continuous edge, really too much so, for they pushed the hair along thead and made trouble for the barber and the customer. What is wanted is an edge that is broken up ever so little, but that little forms minute notches that hold the hair from slipping away. You can't get it by grinding, because you can't help overdoing it.

"It can be done, however, with a special file I bought. Last month Hock's drummer was in here (Hock is to barbers' supplies what Morse is to drills), and showed me the new shears file they are selling. It is an imported file, comes from Australia, and is made by a secret process of special steel. It cuts the hardest blades and gives them that fine serrated edge that I was telling about. I gave him my oldest shears and he sat down and in two minutes had an edge on them. I've got 'em in my hands now, and they're great, I tell you.

"The price of the file was $2, but I put up a kick and he let me have it for $1.75. The drummer showed me how to do the trick and I can sharpen as well as he. Will show you the file as soon as I get you brushed off. They're put up fine, too, and all wrapped in a fancy box."

I took the box he handed me and opened it. The file lay carefully wrapped in a heavy oil paper in a bed of cotton wadding. I examined the tool carefully. It was a particularly good-looking 8 in. file, very fine, with a peculiar "over" cut that I could readily see would produce the edge described. Lastly I looked at the tang.

"What is that?" XFWAAA. Australian? No. "XFW" stands for the Excelsior File Works down in Orangeburg. I knew the shop and the men and the product very well.

That "AAA" was undoubtedly the brand of the new high-speed steel files that I had heard they were bringing out. They sold for 40c. at the factory. Scotty's file had never been nearer to Australia than it was at present, and Scotty had been "stung." The Excelsior Works had boys on the road, too, but they never got over 40c. for what the more enterprising barbers' supply house got $1.75. The latter bought the file in quantities, repacked them, and sold them to a special trade at a special price.

I took a look at the box. Perhaps there was something more. It was a first-class piece of work. The cover bore a handsomely lithographed label. The name of the file occupied a large centre space flanked on one side by the two hemispheres in miniature and on the other by a kangaroo, poised for a jump. Very explicit directions for the use of the file were added. Light blue wadding of good quantity filled the box. There was nothing more.

I handed back his purchase to Scotty, complimenting him on it, for obviously he could get his money's worth out of it and more. Then I paid him and went out. As I walked up the street I tried to find an answer to one of two questions that were uppermost in my mind—whether the barbers' concern was guilty of **sharp** practice in charging outrageously for a little packing, or whether the file works were **slow** and unprogressive in not catering to a special trade that could be so easily and profitably **bled.**

APPROXIMATE RULES FOR ARCHITECTURAL STEELWORK.

SOME useful approximate formulae are to be found in a paper on "Calculations and Details for Steel-Frame Buildings from the Draughtman's Standpoint," recently read before the Concrete Institute by Mr. W. C. Cocking.

The author states that the section

modulus of an I beam is given approximately by the expression.

$$M = \frac{Ws\ d}{10},$$

where Ws denotes the weight of the section in pounds per foot run, and d its depth over flanges in inches. The safe load on 1-ft. span for I sections is approximately

$$\frac{Ws\ d}{2},$$

the corresponding stress being 7½ to 8 tons per sq. in.

For I beams used as pillars, the safe load is approximately equal to the safe load per foot run on a span, which measured in feet is equal to twice the width of the flange in inches, the load being taken as applied laterally, and the column considered as fixed at both ends. For a stress of 7½ tons per sq. in., the section modulus required is $M=0.2\ w\ L^2$, where w denotes the load in tons per foot run, and L the span of the beam in feet.

The approximate weight of a beam to carry a given load is

$$Wb=\frac{W\ L^2}{1000d}$$

where Wb denotes the weight of the beam in tons, W the total equivalent uniform load in tons per foot run, L the span in feet, and d the depth of the beam in inches.

The weight of a column is approximately

$$Wp = \frac{WL}{C},$$

where C is 2500 for both ends fixed, and 2000 for one hinged and the other fixed. In this case, W denotes the total central load on the column, and L its laterally unsupported length in feet. The weight of a beam-casing is approximately

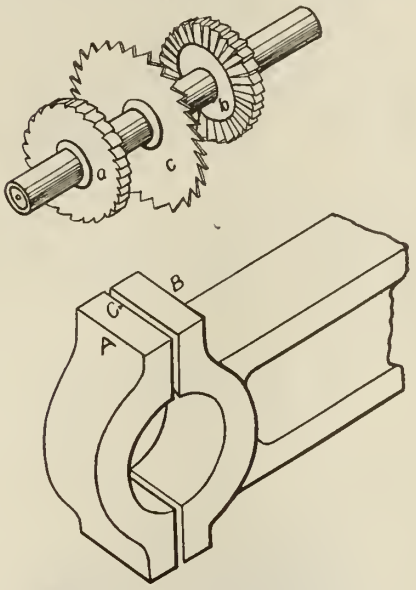
$$Wc=0.00035\ b\ d\ L,$$

where Wc = total weight of the casing in tons, b the breadth, and d the depth, both in inches, whilst L is the length in feet. The same formula applies to columns.

For calculating the effect of eccentric loads on columns, Mr. Cocking recommends the following factors:—For I sections the equivalent central load

=1½ times eccentric load if latter is connected to the web of the I beam,

=2½ times eccentric load if the connection is to a flange.



The corresponding factors for an I-beam column with plates over each flange are 1¼ and 2½ respectively.

For a double I section, with plates riveted to each flange, the factor is greatest when the connection is made to the web of one of the I's and may be taken as 2¾ times the eccentric load.

MILLING CONNECTING RODS.

By A. V. Francis.

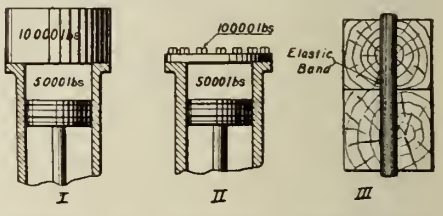
THIS illustrates a method used in milling connecting rods for gasoline engines, where a milling machine was not

MILLING CONNECTING RODS.

available. The milling cutters were arranged on an arbor as indicated, and the connecting rod fastened in a fixture on the cross slide of the carriage, so as to be fed under the cutters by the power cross-feed.

Although this seems a comparatively crude method and was done on a lathe that had seen its best days, so that the tool equipment cost very little, the output was larger than might be imagined and, in fact, compared quite favorably with many milling-machine operations, although it is not illustrated as being the best way to do this kind of work.

TENSION ON CYLINDER STUDS.



By N. G. Near.

I CANNOT refrain from offering my views on the cylinder cover stud question in which I agree in part with Mr. Rodgers. When steam is turned into a cylinder there must be an increase in tension in the studs, but that increase is very small in proportion to the initial tension produced by tightening the nuts.

This pressure slightly compresses the nut and the cover and there must be some compression also in the cylinder itself. All materials, including cast iron and steel, are elastic, the stud alone being elongated. As soon as steam is turned on, a small part of the initial compression in cylinder and cover will be relieved, with the result that there will be a slight increase in the tension of the cylinder bolts, but, as mentioned before, this increase is practically negligible.

A glance at the two cylinder ends shown will make this clear. Fig. 1 is closed steam-tight by means of a 10,000 pound weight, while the joint of Fig. 2 is made in the usual way with the cover pulled down by a total force of 10,000 pounds. The nature of the pressure at both steam joints is about the same and the pressure per sq. in. of metal against metal would be computed in the same way. The real difference is that one joint is elastic and the other is not. The weight in No. 1 would not have to be increased until the total pressure of the steam exceeded the applied load. The studs, on the other hand, are stretched and the tension is correspondingly increased until the slight compression of the metal of the cylinder is relieved. After this takes place, the pressure of the head against the studs is simply transferred from the cylinder body to the steam and little further increase in tension takes place. The exact amount of the increase in tension, of course, would be hard to measure.

Another illustration is shown in Fig. 3, which consists of two blocks of wood held together by a rubber band to represent the elastic tendency of the studs and a thin sheet of rubber between them to represent the elasticity of the cylinder cover and packing. It will be found that the slightest pull stretches the

TENSION ON CYLINDER COVER STUDS.

outer band until the very small compression between the blocks is relieved. Beyond this the blocks will not be separated until a pull is applied equal to the tension of the band.

Question.—A dam is 30 ft. high, and 100 ft. long. What is the total pressure tending to move it from its foundations?

Answer. — Formula = $P = ½\ w\ h^2$ for every linear foot of dam.

In which

P = total pressure in pounds.

w = weight of cu. ft. of water = 62.34 lbs.

h = total weight of water in feet.

In above case, pressure per foot of dam = $P = ½ \times 62.34 \times 30 \times 30$.

Total pressure is

$$\frac{62.34 \times 30 \times 30 \times 100}{2 \times 2000} = 1402.65 \text{ tons.}$$

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

NORTON GRINDING WHEEL STANDS.

A BULLETIN has just been issued by the Norton Company, Worcester, Mass., descriptive of new design (Model D) of floor type grinding wheel stands, equipped with a new design protection and dust hoods. These stands are manufactured with 1¼-in., 1½-in., 1¾-in., and 2-in. spindles, and we understand a 2½-in. machine will be supplied on order.

This new design is an outgrowth of the experience of Norton Company in the use of their grinding wheels on the many types of floor stands now on the market, and the designers have endeavored to incorporate into it every feature that will help to obtain greater production and to give longer life to the grinding wheels and the machine itself. Although not a radical departure from the machines now common in the better equipped shops, it is evident that its designers have given much thought to such features as rigidity, safety, convenience of operation, ease of repair and interchangeability of parts, lubrication and dust removal. Particular attention has also been paid to general appearance as indicated by freedom from sharp corners, recesses and uncovered bolts, and to provision against too frequent replacements by increased weight, oversize spindles and chilled work rests.

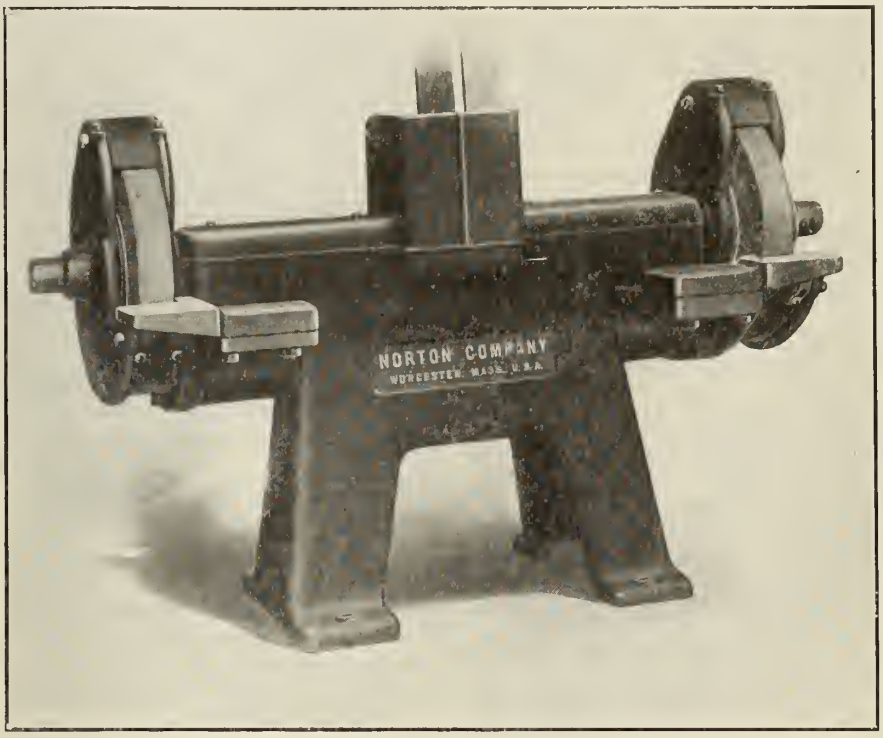


FIG. 1. "MODEL D" GRINDING WHEEL STAND.

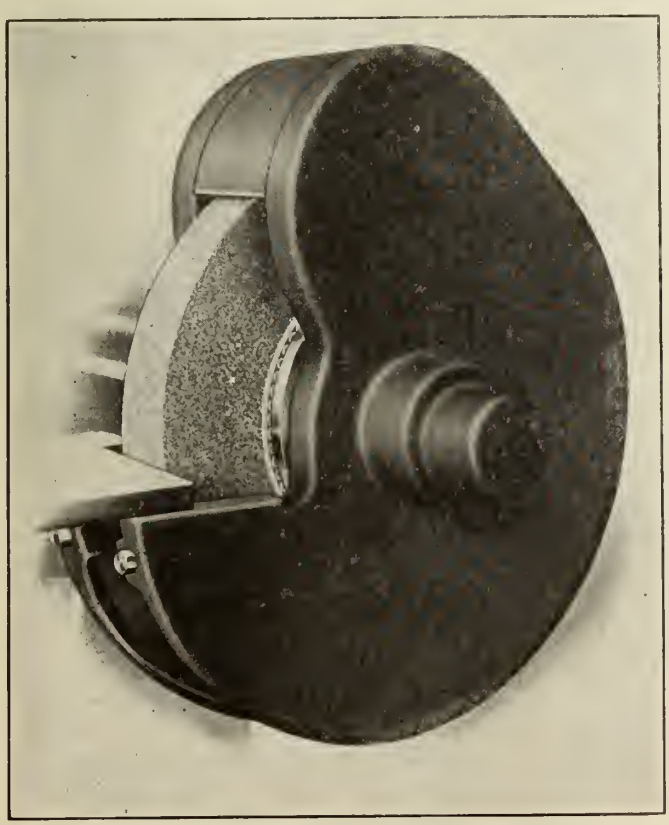

FIG. 2. "MODEL D" PROTECTION AND DUST HOOD (CLOSED).

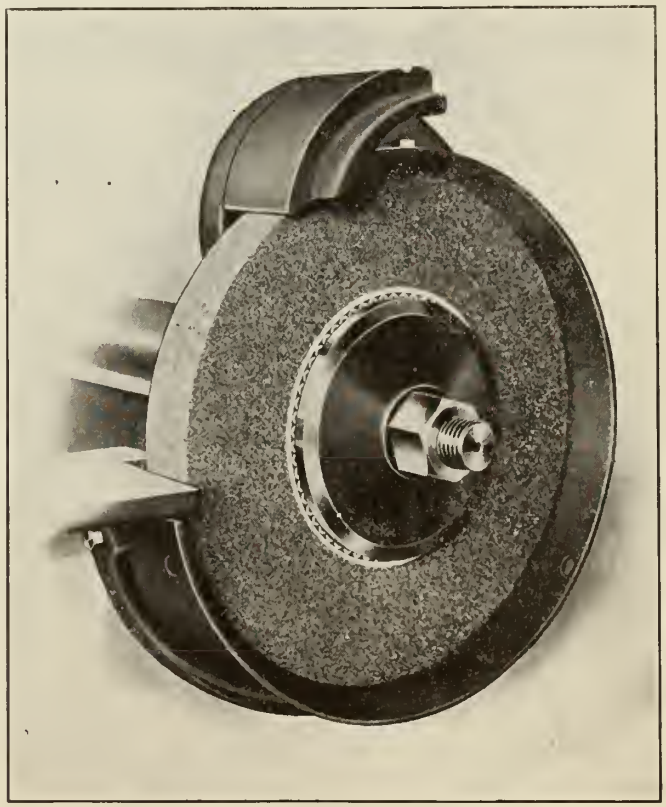

FIG. 3. "MODEL D" PROTECTION AND DUST HOOD (OPEN).

While the foundation space occupied by the machine is small, its weight and rigidity permit of a very desirable overhang of the bearing-bed. This feature allows ample foot-room for the operator. Each bearing is divided into two parts, and the large bearing surfaces help to insure long life. The diameter of the spindle in the bearings is made 1/16 in. oversize, allowing sufficient stock for regrinding when this becomes necessary. The portion of the spindle outside the bearings is made sufficiently long to take taper wheels (½-in. or ¾-in. taper per foot), which have the same width of face as the maximum width of straight wheels. End play on the spindle is easily taken up. The inside flanges are fitted loose on the spindles and driven by a key, making their removal a simple matter. Taper flanges of any make may be used on these machines, if the hole be the right size, by cutting a spline in the hole of the inside flange to fit the square key in the spindle.

Oiling is accomplished by the splash system, insuring positive lubrication. The oil reservoir, under and between the two parts of the bearing, holds a supply of oil sufficient for several months. The design allows ample space for the oil to drain back into the reservoir and be used over and over. All lubricant can be easily and quickly removed from the reservoirs, which are readily accessible for cleaning. Dust-proof covers protect the bearings and oil chambers, and an oil guard inside the bearing-chamber prevents the oil thrown up by the splasher from working out through the joints of the bearing-bed and bearing-cover.

The underside of the overhanging bearing-bed is provided with a machined seat and tee-slots. Work rest brackets, protection hoods and surface grinding attachments are secured by bolts placed in these tee-slots, and may be attached or removed very quickly. All attachments are independent and interchangeable. Whenever it is desired to grind large work that requires the removal of the work-rest, the work-rest bracket can also be removed. This permits the grinding of large pieces without interference by projecting brackets even if the wheel in use be of minimum diameter. The top surface of the work-rest is chilled, insuring longer life, and is considerably increased in size to give adequate support for large and heavy work.

A substantial belt guard, which permits any belt angle from the vertical to 45°, extends two inches above the top line of the maximum size of wheels. This, besides affording protection to the operator, serves to protect the belt when long pieces are ground on the surface grinding attachment. A protection and dust hood, designed especially for the **Model D** floor stand, has the double function of providing protection not only against injury in case of accident to the wheel, but also, when the hood is connected with some suitable dust removal system, against injury to health from inhalation of dust. The bracket which supports the hood serves also as a dust exhaust pipe.

The closed hood consists essentially of a heavy band of boiler plate and two heads or side plates. The hood surrounds about five-sixths of the wheel, leaving a 60° opening. A heavy steel slide provides adjustment for wheel wear. The slide travels in grooves describing an arc around a centre other than the spindle centre, so that, irrespective of the size of wheel, 60° of the periphery of the wheel is exposed for grinding purposes and protection is always afforded. This type of hood covers the end of the spindle, thus preventing an accident due to clothing becoming caught in the thread of the spindle. Through the employment of a special lock nut, the outer head or side plate is easily removed to permit change of wheels.

In addition to the **Model D** type of hood, the Norton Company are also placing on the market a **Model E** hood, designed along the lines of the **Model D**, adaptable to any make or floor stand conforming to the general contour of the Norton stands, it being necessary for the purchaser to provide a suitable bracket, to which may be attached the inner head, which in turn holds the entire structure. This hood is so designed that it is adjustable about the wheel, permitting the grinding to be done on top, at the front, or at the bottom of the wheel. Instead of the bracket, by means of which the hood is fastened to the wheel, serving also as a dust exhaust pipe, the inner head of the hood is solid,

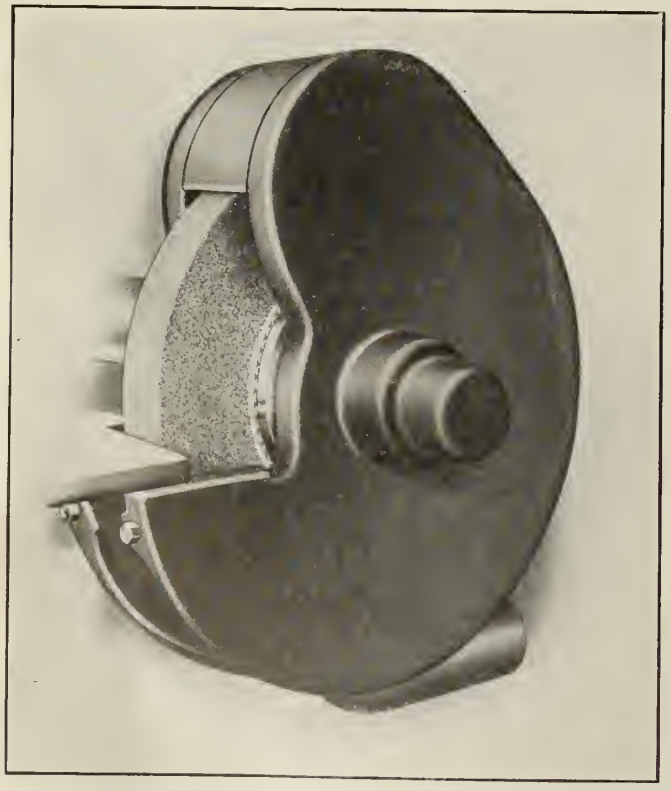

FIG. 4. "MODEL E" PROTECTION AND DUST HOOD (CLOSED).

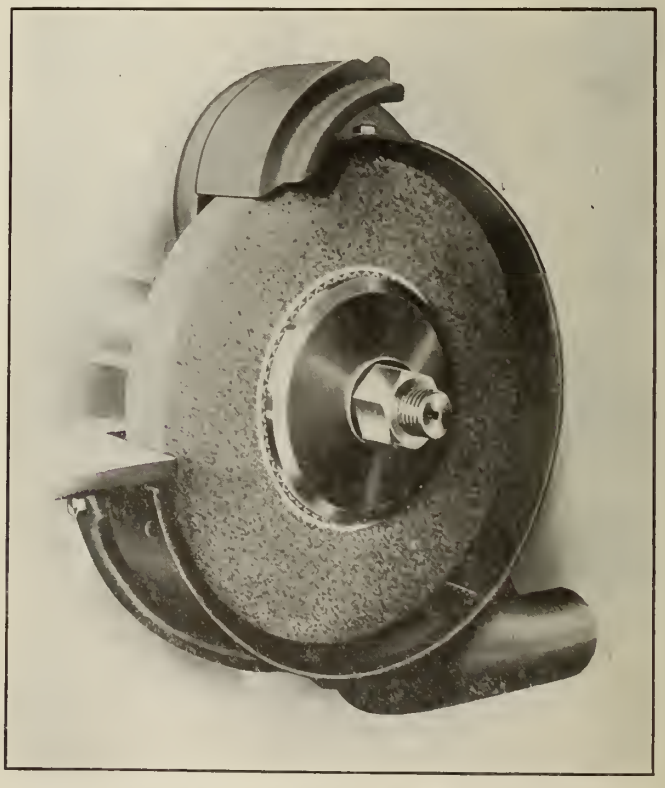

FIG. 5. "MODEL E" PROTECTION AND DUST HOOD (OPEN).

and the exhaust pipe is located on the boiler plate band. The exhaust pipe is mounted on a steel plate of the same radius as the band, and is firmly bolted to the latter.

Model E hoods are furnished with full size band, and the exhaust connection is not attached. The user can readily cut the opening in the band at any desired point and attach the exhaust connection after the hood is located on the machine. The principal dimensions of the 2-inch machine are as follows:—

Diameter of spindle between flanges, 2 ins.; distance between wheels, 62 ins.; entire length of spindle, 79¾ ins.; height from floor to centre of spindle, 30½ ins.; length of bearings, 16½ ins.; diameter of spindle in bearings, 2 3/16 ins.; diameter of flanges, 12 ins.; floor space, 27 ins. by 88¼ ins.; size of wheels (maximum), 24 ins. by 4 ins.; weight of machine and hoods, 1,705 lbs.

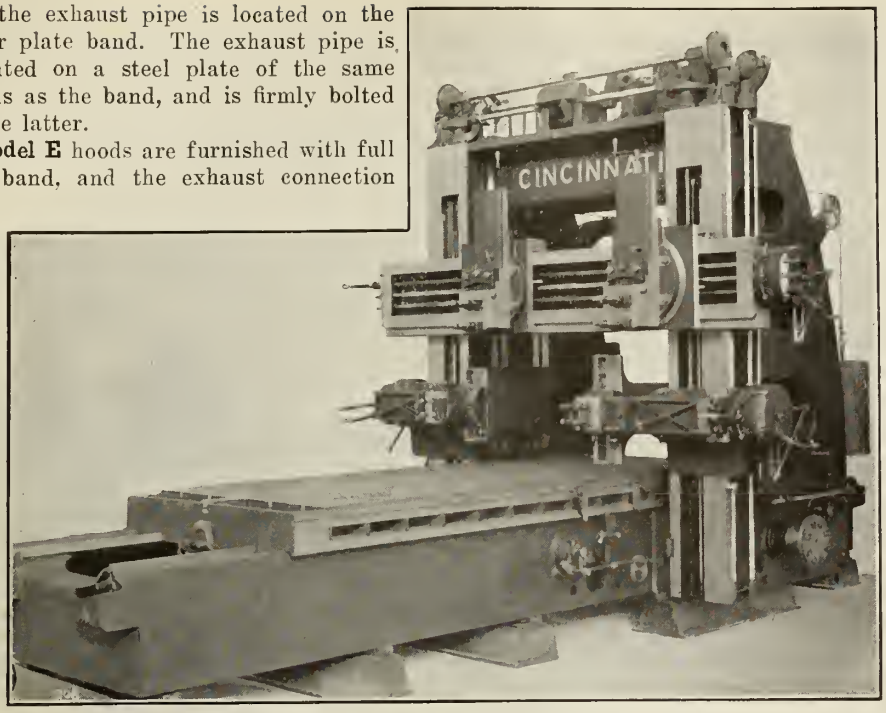

FIG. 1.—CINCINNATI LOCOMOTIVE CYLINDER PLANER.

CINCINNATI LOCOMOTIVE CYLINDER PLANER.

THE illustrations herewith show a 72-inch locomotive cylinder planer built by the Cincinnati Planer Co., Cincinnati, Ohio, and recently supplied to the Canadian Pacific Railway for their Angus shops, Montreal. It has been specially designed for planing locomotive cylinders complete at one setting, and the method of doing this may be readily seen from Fig. 2.

One of the chief features of the planer is the arrangement of the side heads. These are provided with patented adjustable brackets, which give ample support to the heads when reaching far out into the machine, as when planing frame fits, etc. The brackets have a tongue which fits into planed tee slots on the inside of the housings. They are adjustable to suit various types and sizes of cylinders, and can be used in any position between the top of the table and the bottom of the rail. A vertical sliding shoe fits the front of these brackets, and has a dovetail on which the cross-slide of the slide head slides when the latter is fully extended. This design eliminates the twisting strain on the front of the housing, which is caused by the long overhang of the slide and the upward pressure of the tool. If the planer is to be used on other than cylinder work, the slides of the side heads are run back, and the supporting brackets are removed, this being a simple operation.

Each head has rapid power traverse in any direction, controlled by the long levers seen at the side of the heads. These are easily engaged and have a neutral position when not in use. The housings are tied very rigidly together at the top by a heavy box arch, and at the bottom are locked to the side of the bed by large tongues, dowels and bolts.

The table is of the box type and runs on vees that are oiled by forced lubrication supplied by a pump which is driven

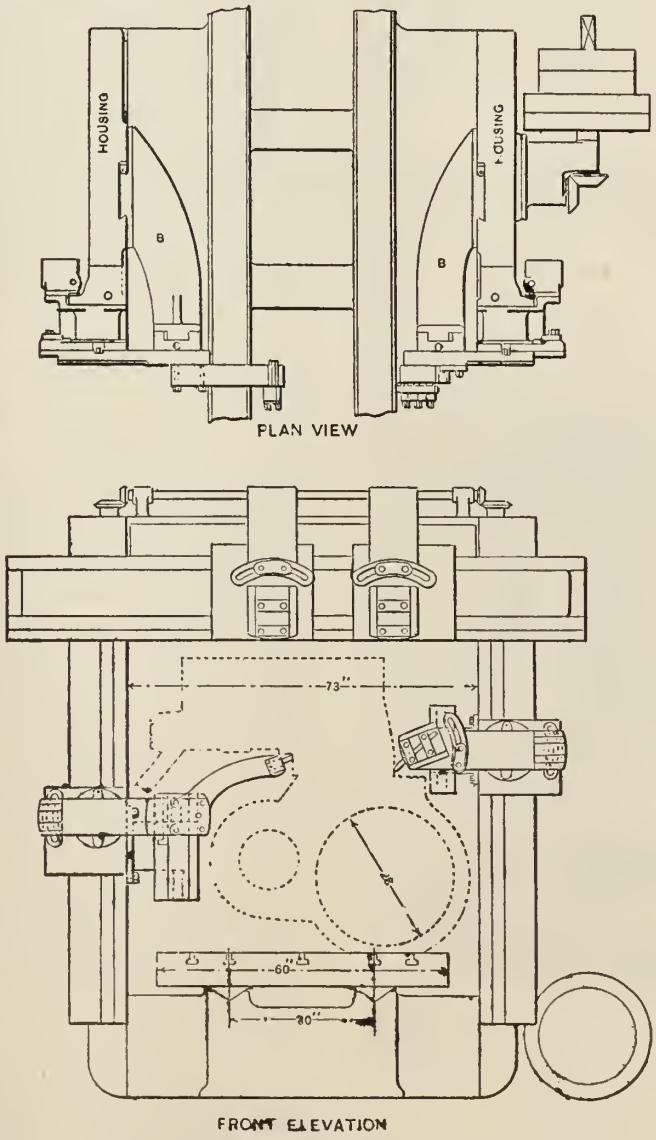

FIG. 2.—CYLINDER PLANER SHOWING METHOD OF SUPPORTING SIDE HEADS WHILE PLANING THE FRAME FITS.

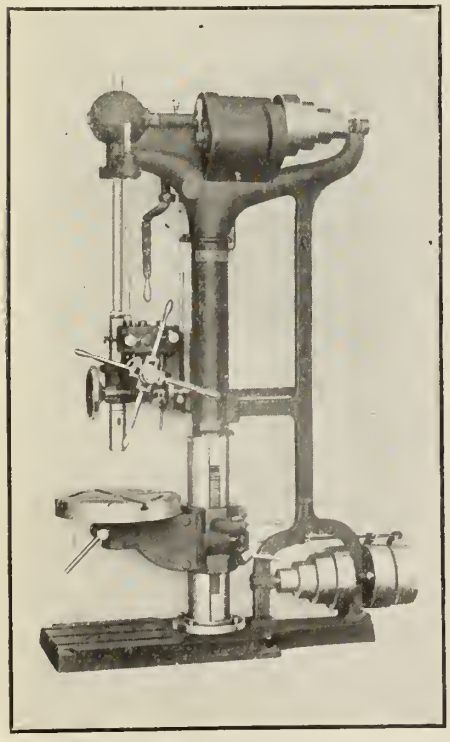


by a belt from one of the shafts on the top arch. This planer can be arranged for either electric variable speed motor, reversible motor, or belt drive.

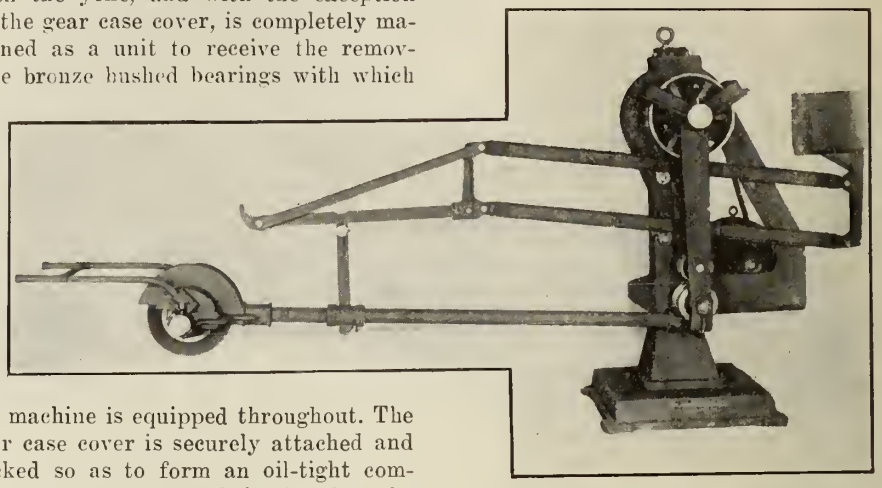
The machine supplied to the Canadian Pacific Railway is driven by a "Lancashire" reversing motor operating on the Lancashire system of planer control off a 3-phase, 550-volt, circuit. The motor gives cutting speeds on the planer of 15 feet to 45 feet per minute, with a return speed of 90 feet per minute. About thirty cutting speeds between the above limits are provided, these being obtained by movement of the speed regulator handle. Push buttons are provided on each side of the planer for starting and stopping.

The drive was supplied by the Lancashire Dynamo & Motor Co., of Canada, who state that their system is the only one that can be operated on an alternating current circuit. For short stroke work, such as cylinder planing, an increased efficiency of at least 40 per cent. is claimed over a belt drive. Moreover, with a reversing motor drive, the variation of length of stroke is negligible, so that the difficulty usually experienced with belt driven planers when planing up to a shoulder is not met with.

HIGH-SPEED VERTICAL DRILLING MACHINE.

ANOTHER improved design of vertical drilling machines is herewith illustrated. The manufacturers, recognizing the growing demand for a more perfect lubrication of the high-speed moving parts of this class of machinery, which on account of their position are generally neglected by the operator, have completely encased in fixed oil retaining housings the friction back gears and spindle-driving gears. This method of lubricating trains of gearing has been applied to some classes of machine tools.

HIGH-SPEED VERTICAL DRILLING MACHINE.



The back gear case is cast integrally with the yoke, and with the exception of the gear case cover, is completely machined as a unit to receive the removable bronze bushed bearings with which the machine is equipped throughout. The gear case cover is securely attached and packed so as to form an oil-tight compartment to enable lubrication by the splash system. One supply of lubrication will last for months with the assurance of no moving parts being subjected to unnecessary wear. This construction protects the bearings and gearing from dirt, confines the gear noises, and avoids the throwing of oil on operator or floor.

The machine illustrated is 21 in. size, and is the product of the Superior Machine Tool Co., of Kokomo, Indiana.

PORTABLE RADIAL SWING GRINDER.

THIS grinding machine is made for the purpose of grinding large and medium-sized castings and doing other general buffing work. It will perform the various functions of a stationary swing grinder and many others that cannot be done on a swing grinder permanently installed. The grinder is wholly self-contained, and is driven by a motor mounted on a suitable platform which is part of the main housing. The counterbalance for the swinging arm and grinding head is also mounted on the main housing. The machine may be put in any convenient place in the shop, and needs no preliminary work for setting up. Its portability permits it to be carried anywhere by a crane and placed at the work, while the eye on the top of the pedestal makes it convenient for hooking to the crane.

It is a complete radial grinder, the arm with the grinding head turning the entire circumference about the base. The grinding head and the swinging arm is carried back and forth by a roller-bearing trolley which rolls on a track held in a horizontal position by two parallel arms. At the back or other end of these arms is placed the counterweight. These parallel arms keep the head balanced for any position of the trolley on the track. This arrangement gives a free and easy movement to the swinging arm and eliminates the tendency of the latter with its weight finding its centre of gravity,

PORTABLE RADIAL GRINDER.

generally an annoying feature. The grinding head can be twisted in either direction, to the right or to the left to an angle of 90 degrees. The emery wheel is driven by a single belt which is carried around the jointed connection of the swinging arm and hanging swing frame, by two self-oiling idler pulleys, thence to the large pulley at the top. The upper pulley is driven by a shaft from the drive pulley on the inside of the housing. To this drive pulley the motor is belted.

The machine is mounted on a substantial base which supports a vertical pedestal. On this pedestal is mounted the main frame or housing which is free to turn thereon. On the side of the housing is placed a strong bracket carrying the swing frame in which the pulleys are carried. At the lower end of this frame is jointed the swinging arm to which the grinding head is attached at its outer end. The swing frame hangs on two phosphor bronze bushings put through the top bracket, these bushings forming the bearings for the drive shaft.

The emery wheel in the grinding head is shielded by a hood over the top, while the handles attached to the head enable the operator to get a good hold, and to have full control of the head. The wheel arbor runs in phosphor bronze bearings having provision for taking up the wear. It has safety flanges and will take a wheel 18 inches diameter by 3 inch face. A safety shaped wheel is recommended.

The machine, which is rigidly and strongly constructed to withstand hard service, is a product of the Mummert-Dixon Co., Hanover, Pa.

Series of Practical Questions and Answers for Mechanics

Every care is being taken to include only pertinent practical questions, and give same direct, reliable answers. Catch questions will be avoided. Attention is drawn to the alternating course in arithmetic, a concurrent study of which is recommended with that of the Question and Answer Series.

PROBLEMS IN HYDROSTATICS.

HYDROSTATICS deals with the equilibrium of liquids or with liquids "at rest," whether under pressure or not.

A cubic foot of water weighs 62.35, or approximately 62½ pounds. The weight of a cubic inch is .036 pound. As water is very nearly incompressible, it is particularly useful for transmitting great pressures.

If a body is submerged in water, it is pressed upwards with a pressure equal to the weight of water it displaces, and it is subjected to a pressure equal to the weight of the water above it.

If a liquid be subjected to pressure, that pressure is transmitted equally in every direction except in cases where the weight of the liquid naturally adds itself to the downward pressure.

* * *

Question.—A cylindrical tank, 20 ft. high, is filled with water. What would be the downward pressure on the bottom and the lateral pressure at a point three feet from the bottom in pounds per sq. in.?

Answer.—The pressure on the bottom would be equal to the weight of a column of water one inch square and 20 ft. high, which is

$$20\times12\times.036=8.64 \text{ pds. sq. in.}$$

The lateral pressure three feet from the bottom would be

$$(20-3)\times12\times.036=17\times12\times.036=7.344 \text{ pounds.}$$

* * *

Question.—The steamer Titanic is supposed to be five miles below the surface of the ocean. What would be the external pressure in pounds per sq. in. upon one of her boilers, which happened to be closed up at the time of sinking?

Answer.—Five miles$=5\times5280=26400$ ft. Pressure per sq. in. then is $26400\times12\times.036=11.404.8$ pounds, or nearly 6 tons.

* * *

Question.—What would have to be the pressure upon the piston rod of a 6-inch pump in order to lift water 300 ft.?

Answer.—The 6-inch piston would have to support a column of water 300 ft. high, and, therefore, would be subject to a pressure of

$$300\times12\times.036=129.6 \text{ lbs. sq. in.}$$

Area of piston $=28.2274$ sq. in.

Total load on piston and rod would be

$$28.274\times129.6=3704.3 \text{ pounds.}$$

Question.—A floating drydock is 200 ft. wide and 600 ft. long. How deep would it sink under the weight of a steamer of 20,000 tons displacement?

Answer.—The dock would have to sink enough to displace 20,000 tons of water.

$$20{,}000 \text{ tons of water occupies} \frac{20{,}000\times2{,}000}{62.35}$$

$=6415.39.7$ cu. ft.

Area of dock $=600\times200=120{,}000$.

$$\text{Depth to which it would sink} = \frac{641{,}539.7}{120{,}000}$$

$=5.34$ ft.

* * *

Question.—The pressure in a water pipe before the water is turned on is 30 lb. per sq. in. Neglecting friction and other losses, how high should the water go if shot vertically upwards from a nozzle?

Answer.—Theoretically, the water should spout to the same height as would be required to produce the above as a hydrostatic pressure.

.036 lb. is produced by 1 inch of water.

30 lb. would be produced by

$$\frac{30}{.036} \text{ in. or } \frac{30}{.036}\times\frac{1}{12}=69.44 \text{ feet.}$$

which is the height to which the water would rise if no losses were incurred.

* * *

Question.—A hydraulic jack has a pump piston ⅜ in. in diameter and a ram 2 in. in diameter. It is operated by a lever 22 in. long, pivoted at the end, and with the plunger attached 2 in. from the same end. With 50-lb. pressure on the end of the lever, how much could be lifted by the jack?

Answer.—The power arm of the lever is 22 inches and the work arm is 2 in. With a pressure of 50 lb. on the power arm the pressure on the small piston would be

$$\frac{50\times22}{2}=550 \text{ lb.}$$

The area of power piston = area of ⅜-in. circle $=.1104$ sq. in.

Area of load piston = area of 2-in. circle $=3.1416$ sq. in.

550 lb. operating on every .1104 sq. in. of the 3.1416 sq. in. would give a lifting power of

$$\frac{3.1416}{.1104}\times550=15651.1 \text{ pounds, or}$$

about 7.8 tons.

Question.—James Watt fed his boilers by raising the water tank high enough to cause the water to flow into the boiler by gravity. If the steam pressure were 60-lb. per sq. in., how high would he place his tank above the boiler?

Answer.—The height of water necessary to overcome 60-lb. boiler pressure would be

$$\frac{60}{.036}\times\frac{1}{12}=138.8 \text{ feet.}$$

* * *

Question.—If the atmospheric pressure be taken as 14.7 lb. per sq. in., how high would a theoretically prefect pump lift water?

Answer.—The water could be lifted high enough to balance its pressure against that of the atmosphere or

$$\text{Height}=\frac{14.7}{.036}\times\frac{1}{12}=34.207 \text{ feet.}$$

* * *

Question.—The steel hull of a ship weighs 7,400 tons. How much would it weigh at the bottom of the ocean?

Answer.—Steel weighs 489.6 lbs. per cu. ft. No. of cu. ft. of steel =

$$\frac{7400}{489.6}\times2000=3022.87,$$

which is the volume of the water displaced. Weight of sea water displaced $=3022.87\times64.085=193{,}720.62$ lbs. 7400 tons $=14{,}800{,}000$ lbs. Actual weight of hull $=14{,}800{,}000-193{,}720.62=14{,}606{,}279.38$ lbs. $=7{,}303.14$ tons.

* * *

Question.—The side of a cast iron water tank is fastened at top and bottom. The tank is 8 by 12 by 9 feet high. When the tank is full what would be the strain (a) on top fastenings (b) on bottom bolts?

Answer.—Formula, $P=½\ w\ h^2\times$ length, or total pressure against one side $=½\times62.34\times9\times9\times12=30{,}297.24$ lbs. It can be proved that this pressure may be considered to act at a point one-third of the distance from the bottom. Force acting against the bottom fastenings or tending to push bottom edge out would be

$$\frac{2}{3}\times30297.24=20198.16 \text{ lb.}$$

or 10.099 tons nearly.....(b)

The force tending to strain bolts at the top is

$$\frac{30297.24}{3}=10099.08 \text{ lbs.}$$

or 5.049.54 tons nearly .....(a)

THE COUNTRY PLANT.

THE policy of a number of large manufacturing firms, especially the older established institutions of the United States, in locating their Canadian plants in the country districts and small towns may be taken as a sign of the times. Some of the advantages of such situations are, of course, known only to the master minds of these industries and are the outcome of particular requirements; nevertheless, many of the country attractions are evident even to the casual layman.

The possibility of successfully locating in the country is limited, at present, to the larger institutions which can buy nearly all supplies in car or train load lots straight from the producers. Automobile transportation has made possible locations of small plants at considerable distances from large supply centres, but this in Ontario is again offset by the notoriously bad country roads. The man who has to buy his materials in retail lots must still be conveniently near his source of supply.

The labor problem which at first thought, looms large, has been successfully solved by the portable lumber mills of the West which go to the heart of the forests, as well as by some of the largest machine tool makers of the East. There are, no doubt, a number of high-class mechanics who prefer the comforts? of the metropolis to the freedom of the country or village life, but the reliability of the men who seek the quiet life forms a very strong counter attraction in the eyes of the employer. Then again, a large part of the manufacturing processes are being so changed by the introduction of automatic machines and methods as to require the physical and mental conditions incident to the life of the smaller centres of population rather than the product of strenuous city surroundings.

The cheap and wide circulation of both news and instructive literature, the formation of social and instructive societies and entertainments applicable to small units and the increasing available forms of transportation are rapidly putting intelligence and alertness in their proper place as an accompaniment of country life.

Let our newer industries follow the lead of the younger branches of the older firms and establish their factories in places where their future workmen can have homes of their own, a cleaner life and a chance to reduce the cost of living. Lower tax rates and more contented operatives will not be the only benefits the employer will derive from a business thus founded on humanity.

THE USE OF MULTIPLE DRILLS.

THE multiple spindle drill is one of the tools that has not been imposed upon by being intemperately used. In frequent trips of inspection through different plants one cannot but be struck by the lack of these labor-saving devices. Cases are common in crowded factories of from four to six single spindle machines being operated by one man drilling different holes in the same piece of work and moving it from one machine to another for each separate hole. If the six spindles were put on one machine, about three-fourths of the labor and floor space could be saved, the latter a most attractive feature where city land values must be figured.

We know of a plant where an elaborate fixture was provided for drilling eccentric straps. The operative, one day, set the job up between two radial drills which were situated close together and was able, in this way, to drill both holes at once. It was nearly a year before this firm decided to put an auxiliary spindle on the arm of one of the drills and thus confine the job to the one machine. This change alone almost cut the time in two for a large number of straight line jobs.

The system of making a multiple drill head for single spindle drills as a part of the drilling machine fixture for each job is bound to grow in popularity, and the method is greatly facilitated by the cheap production of accurate pinion stock and good universal joints. Let each tool room superintendent take a critical trip through his own shop and figure out how much could be saved by making his multiple jobs into single ones.

INDUSTRIAL NOTABILITIES--No. 37

LIEUT.-COLONEL JAMES W. WOODS, vice-president, Smart-Woods, Ltd., Ottawa; president, Blanket Mills, Renfrew; vice-president, Imperial Realty Co.; vice-president, Ottawa Uplands, Ltd.; vice-president, Elgin Realty Co., and president, Empire Cotton Mills, Ltd., was born at Kildare, Que., April 10, 1863, son of Russell Woods, a successful farmer and lumberman, whose ancestors were from Kildare, Ireland, and Anne J. (Davis) Woods, of Canadian parentage, she having been born at Longueuil, Montreal.

He was educated in private schools and at Montreal College, and at an early age entered the service of Rankin, Beatty & Co., Montreal; later serving with A. W. Ogilvie & Co. for three years. He next associated himself with Hodgson, Summer & Co., Montreal, representing them in Ottawa district for eight years. He established business on his own account in 1895, and by his persoual effort and ability has built up the largest and most successful contractors' and lumbermen's supply house in Canada. This progressive concern, now known as Smart-Woods. Ltd., occupies a large factory, covering many acres, at Hull, C...

LIEUT.-COLONEL JAMES W. WOODS.

Besides constructing this plant, he is also the builder and owner of the Woods Building, now occupied by the Government, and housing the Military Department, also the Canadian Building adjoining same. Both of these splendid structures are of stone, and modern in every respect.

Mr. Woods is one of the most active and progressive manufacturers, and a most substantial public-spirited and patriotic citizen of the Dominion of Canada. He is a vice-president, Canadian Manufacturers' Association; vice-president, Ashbury College, Rockliffe, etc. He was president, Ottawa Board of Trade, 1907-1908; chairman of Citizens' Committee of Finance that raised a fund of $200,000 for the Y.M.C.A. of Ottawa, and one of the most active members of that body. He is Lieut.-Colonel of Governor-General's Foot Guards, and was elected an honorary member of the famous Guards Club, London, England, during 1909-1910, when attached to the Coldstream Guards. Lieut.-Col. Woods is permanent chairman of finance of the Earl Grey Musical and Dramatic Competition, which is held in various parts of the Dominion for the purpose of promoting the higher forms of musical and dramatic art, and is a great lover of art, having in his collection at Kildare House, Ottawa, examples of most of the Barbazon and Dutch schools of art, etc. He married Ida E. Edwards, daughter of John C. Edwards, Ottawa, on Oct. 18, 1893, and has three sons and two daughters.

His clubs are Ottawa Hunt, Rideau Country, Mount Royal (Montreal), Toronto (Toronto), Manitoba (Winnipeg), etc., and his residences are Ottawa, Ont., and "Kildare Lodge," St. Patrick, on the lower St. Lawrence.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., June 1, 1914.—There has been very little change in trade conditions this last week, and most firms report business as being much the same as during the last couple of months. So far as the machinery market is concerned there is very little "big" business passing, but smaller orders are coming quite freely. Slow collections are still prevalent, and most dealers claim that if it were not for this feature they could sell a lot of machinery. At present people are asking from six to nine months, and under these conditions dealers almost prefer to hold their stock until better terms can be arranged. There have been one or two fair-sized sales made during the past week.

Comparing the present situation with that of the last few years, one of the local men said to-day: "The years 1910-11-12 and the first part of 1913 were extra good from a business standpoint, and, as the population increased, everybody went ahead equipping their plants and factories in order to keep up with a growing demand. This, of course, resulted in a great outlay of money all round, and the banks, realizing the growth of population and general prosperity throughout the country, were quite willing to advance the needed capital. The result has been that we are at present equipped to supply a demand that is not half the actual output when all firms are running full time. It also means that most firms, being stocked up pretty well, have found it necessary to cut down their operations to about one-half, resulting in a large number of men being thrown temporarily out of work. The general attitude seems to be a waiting one, and it is hoped that this year's crop will be so close to record as to go a long way towards putting business on a better footing."

Metals.

The continued weakness in tin is practically the only feature of this market apart from the fact that business still continues quiet. This week there has been a further decline of ½ cent per pound in tin, and the same feeling remains, notwithstanding the decline.

Pig iron remains unchanged in price, as does the demand. Local dealers seem to think that pig iron is a very good buy at present figures. It would, however, be rather difficult to base one's requirements for the future owing to present conditions.

It is quite evident that stocks are none too heavy, and although there is very little buying going on at present, everything being done in a hand-to-mouth manner, the inquiries that are being received at present would lead one to believe that there will have to be considerable lead bought in the near future. Everybody is dickering for lower prices and buying small.

It is claimed by sellers that most of the foundries are running pretty low so far as stocks are concerned, but will not contract for any quantity until they have something to work on in the way of actual requirements.

Toronto, Ont., June 2, 1914.—Business conditions generally are still very quiet, but there is encouragement in the annual report of the Imperial Bank recently published. The president, in his review on trade conditions, exhibited a feeling of conservative optimism, calculated to strengthen the feeling of confidence which we believe is gradually becoming evident. From such an authority as Mr. D. R. Wilkie this optimism comes at an opportune moment, especially as his opinions are based on a thorough knowledge of conditions prevailing among the various industries of the Dominion. A return of trade to the previous high level must of necessity be slow, but it will be all the better if the improvement does come gradually and so allow for a natural adjustment to take place. Political affairs are still unsettled, which has a tendency to retard the growth of that spirit of confidence among business men, so much needed for the development of the country.

The national Town Planning Conference, which has been held here, under the auspices of the Conservation Commission, was productive of several interesting and instructive papers and discussions. Delegates from all over Canada and the United States and a number from Great Britain attended to give each other the benefit of their views. An interesting feature of the conference was the exhibition of drawings and photographs covering the various subjects discussed.

The iron and steel markets are in the same quiet condition as last week, no improvement has as yet become evident, although it is thought that soon there may be a change for the better. Prices remain at the same level and are likely to do so for some time. At a meeting of the American Iron and Steel Institute held recently in New York, the general opinion appeared to be that low prices would be seen through most if not all of the second half, the conditions apparently being too baffling to allow of the members giving any definite opinions, although a few spoke in a more or less optimistic vein.

The demand here for structural steel does not improve to any noticeable degree and the railways have not come into the market as yet for any considerable amount of material.

No change is to be noted in the pig iron market, prices remain on the same level and the demand does not seem to increase. It is reported from the United States that there has been considerable activity in basic iron in the Philadelphia and Chicago districts and a heavier de-

mand for foundry grades in some other centres.

Business in machine tools continues to keep in much the same condition. Dealers report that business is quiet; buyers apparently still holding off pending a return of better times. A local concern reports having sold a McDougal lathe and a Barnes drill press to the A. B. Ormsby Co. of this city.

The metal market is quiet, prices generally being unchanged. An improvement in business is, however, looked for in the near future.

Winnipeg, Man., May 30, 1914.—Few new machine shops have opened up lately, but quite a number of concerns are talking about building; these include a prominent bridge and ironworks in one of the western provinces. Inquiries for machine tools are coming in pretty freely. One city firm of machine tool brokers report having received inquiries for eight lathes.

Among the new concerns who are contemplating building is the Winnipeg Oven and Tool Co., with which is incorporated the Dominion Oven Co. and the Winnipeg Tool and Forging Co. They are figuring on erecting a plant at Elmwood, Man., for the manufacture of steam and hot air ovens, and to erect and install all equipment necessary for the use of bakers. The steam-heated oven is extensively used in bakeries and hotels throughout the British Isles, but is not so popular in this country. George W. Jones, Winnipeg, has invented a new type of oven, and together with Luther Holling, a well-known Winnipeg machinist, is going into the above business.

Besides bakers' supplies, they will also manufacture tools for blacksmiths, contractors and builders, and for the plumbing and steamfitting trades.

The demand for tool steel in the West continues fair, although no big orders are being placed. The impetus given to the oil business at Calgary and throughout the West is having some effect. Orders for tanks, etc., are being placed with local concerns, some of whom have been buying pneumatic tools for construction purposes. The rolling mills at Selkirk, Man., will not be in operation until next September in all probability.

A CANADIAN TRADE CAMPAIGN.

THE Canadian Chamber of Commerce in London, England, which has recently left its old quarters in the Royal Colonial Institute to share the building of the London Chamber, on Cannon Street, has just issued a circular in which an important proposal is made for "a Canadian trade campaign."

Admitting that some considerable time must elapse before the scheme of the British Manufacturers' Exhibition train can be successfully launched, the chairman (Hon. J. H. Turner) invites British merchants and manufacturers to consider the following proposals:—

That a Canadian trade fund be instituted, to which members shall be asked to subscribe from $50 to $125 each, according to the scope of the campaign and the number of firms participating. The fund to be utilized for a year's campaign on the undermentioned lines, the extent of its operations, of course, to be confined strictly by the total amount of the fund. As the trade campaign is to be conducted by the British manufacturers' section of the chamber for the benefit of their members only, the actual programme will depend upon the ultimate membership of the section and the trades most largely represented.

In order to prevent duplication of work and for mutual help and guidance, commissioners—though working independently—should not only keep in touch with each other, but should act under the advice and in consultation with C. Hamilton Wickes, his Majesty's Trade Commissioner in Canada.

MONTREAL LIGHT, HEAT AND POWER CO. REPORT.

SUBSTANTIAL gains in gross revenue and net earnings after operation and maintenance charges are shown in the thirteenth annual report of the Montreal Light, Heat and Power Co., published on May 26. Gross revenue amounted to $6,245,697, an increase of $736,141, or 13.4 per cent., while the balance of $3,467,246, after operation and maintenance, was $3,467,246, an increase of $286,130.

The new departure of deducting the depreciation and renewal reserve appropriation before fixed charges and dividends, instead of after, as formerly, makes necessary a readjustment of the various items of the profit and loss statement, after operation and maintenance, should any further comparisons be made. If the statement be thrown back into the old form it would show a balance, after charges, available for dividends, of $2,999,245, an increase of $282,131 over last year, and of $641,000 over the year before that. On this basis the company earned 17.6 per cent. on its $17,000,000 paid-up stock, against 15.9 in 1912-13 and 13.8 in 1911-12.

If the comparison be made the other way—that is, by deducting depreciation and renewal reserve appropriation before bringing down profits available for dividends in 1912-13 and 1911-12—then earnings on the stock were 14.1 per cent., against 12.7 the previous year, and 10.9 per cent. the year before that.

Whichever way the comparison be made, it is apparent that the company earned, roughly, between 1½ and 1¾ per cent. more on its stock than it did in 1912-13. Six hundred thousand dollars was reserved for renewals and depreciation. The net surplus carried forward for the year was $689,268.

HANDS OFF MARINE RATES.

REPRESENTATIVES of the manufacturing and shipping interests strongly protested before the special railway committee on May 28 against the proposal of placing shipping rates under the jurisdiction of the Railway Commission.

J. E. Walsh spoke for the Canadian Manufacturers' Association, and emphasized particularly the competition of the United States boats. While conceding that control was desirable, he held that an investigation of conditions should be made.

W. R. Dunn, of the International Harvester Co., Hamilton, said that, if the legislation went through, the company would have to do away with its Hamilton terminals, since it would be driven off the water altogether. It would be cheaper for it to ship from its Chicago factory to the West once water competition was eliminated, as he predicted would result.

WESTERN CONDITIONS.

IN an interview given out at Montreal recently, Mr. J. S. Dennis, Assistant to the President and head of the Department of Natural Resources of the C.P.R., and reputed to be one of the most reliable authorities on western affairs, said: Business conditions on the railway as well as in the cities and towns are quiet at the present, but are beginning to show marked evidences of stimulation owing to the splendid spring weather and a consequent early movement of people to the western section of the Dominion. The abnormal growth of urban centres is credited with causing the depression of the past year, and the city development is now waiting for the necessary industrial and agricultural growth to catch up. When the two are more nearly on a level the prosperity of the past will begin to be appreciable again.

It is too early to speak of crop conditions, yet the spring indications are very encouraging and promise well for excellent returns. Immigration has dropped off to some extent, but this is only due to the holding back on the part of artisans and laborers. The numbers who are taking up land for the purpose of "sane" agricultural development or mixed farming are becoming larger each year.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Fort William, Ont.—Preliminary work has been started on the site where the Conley Switch Mfg. Co. will build their plant.

Weyburn, Sask.—The town council have decided to purchase a steam engine and generator. Tenders will be called shortly.

Vancouver, B. C.—The British Columbia Platinum Co. will start operations this month in the Tuluamen district.

Goderich, Ont. — The Water and Light Commission are considering the question of installing an electric-driven pump at a cost of $5,000.

Kingsville, Ont.—The Dominion Stove Co. will erect a plant to cost $12,000. J. C. Pennington, La-Belle Building, Windsor, Ont., is the architect.

Regina, Sask.—Two new stokers will be ordered at a cost of $6,900 from the Sandford-Riley Stoker Co., and installed in the new power house now being erected.

St. John, N.B.—The sawmill and machine shop owned by B. L. Moore was destroyed by fire recently, the loss being estimated at $8,000, a part only covered by insurance.

Medicine Hat, Alta.—The Pump and Brass Works are making considerable extensions to their plant, and adding to their stock of patterns and equipment. Geo. E. McDonnell is manager of the company.

The Kawneer Mfg. Co., of Toronto, Ont., has purchased a site covering seven acres at Guelph, Ont., where they will build a factory 40 x 500 feet for making art metal mouldings for store fronts, etc.

Sarnia, Ont.—It is reported that the H. Mueller Mfg. Co. have 154 men at work in their factory. They are rushed with orders, and are installing a number of new machines in their already well-equipped factory. They are so rushed with orders that the company are considering the advisability of working twenty-four hours a day.

Vancouver, B.C.—At a meeting of the city council of North Vancouver held last week it was announced that Fowler Bros. had taken over the Mainland Iron works, which would be moved across to the North Shore on property controlled by J. P. Fell. The industry will be greatly enlarged, the new development including a graving-dock and a shipbuilding and repairing plant. Work will be commenced at once.

Regina, Sask.—Negotiations for the erection of a large engineering plant at some point in Saskatchewan are under way at the present time by a Regina firm in co-operation with an American syndicate. A plant will be erected at a cost of about $50,000 to employ about 50 men. The company will manufacture gasoline and kerosene lighting lamps. Negotiations are being carried on between the local men and the Board of Trade at Kerrobert, who are offering a free site and have also guaranteed to finance the enterprise to the extent of $25,000, which will be subscribed by citizens of Kerrobert as capital stock.

Municipal

Stratford, Ont.—Tenders are being called for the construction of sewage disposal works.

Beaconsfield, Que.—The town will make extensions to its electric light plant, to cost $20,000.

Verdun, Que.—The town will make extensions to the waterworks and electric light plant this summer.

Vegreville, Alta.—It is proposed to make an extension to the municipal lighting plant, to cost $25,000.

Montreal, Que.—The Board of Control have suggested that the city should purchase twenty-three sprinkling wagons.

Berlin, Ont.—The board of health has reported that the city's water supply is not pure. A filtration plant will probably be installed.

Bridgeburg, Ont.—A by-law was carried on May 25 to spend $7,000 on good roads. Tenders have been called and awards will be made shortly.

Fort William, Ont.—Extensions will be made to the electric lighting system, and a new sub-station will be erected in the near future to cost $75,000.

Toronto, Ont.—Commissioner Wilson of the street cleaning department, is asking for two street cleaning machines. The estimated cost is $1,200 each.

South Vancouver, B.C.—The council proposes to spend $650,000 this year on permanent works, consisting of waterworks and sewage disposal system.

Winnipeg, Man.—The city will probably purchase two automobiles, 600 gallons capacity storage tank, and 15-water pressure gauges for the fire department.

Minnedosa, Man.—A by-law will be voted on by the ratepayers on June 5 to authorize the guarantee of bonds for $50,000 for the Minnedosa Power Company.

Woodstock, Ont.—The city council on May 26 gave the first reading to a by-law providing for the raising of debentures to the extent of $75,000 for a new city hall.

London, Ont.—The Board of Control have received tenders for a motor tractor for the fire department from the Knox Co., the La France Co., the White Motor Co., and the Seagraves Co.

Sherbrooke, Que.—Of the three by-laws voted on by the ratepayers, two were carried, these being the Hamilton Shoe Co. and Canadian Rand Co. by-laws. The C.P.R. by-law was defeated.

Kincardine, Ont.—The ratepayers, on June 25, will vote on a by-law to raise $3,500 in debentures for the purpose of changing the street lighting system of the town from the arc to the incandescent system.

Port Arthur, Ont.—It is proposed to construct a pumping station, disposal works, etc., at a total cost of $2,500,000 and to spend $550,000 for extensions to the waterworks system. These extensions include duplicate motor-driven pumps, etc.

Cranbrook, B.C.—It is proposed to increase the water supply by building a new reservoir and laying a steel pipe line to replace wood stave pipe. The estimated cost is $110,000, and a by-law will be submitted to the ratepayers on June 10.

Morris, Man.—On May 19 voting took place on the gas by-law, to sell the Morris Gas plant to the Acetylene Construction Co., of Montreal. The by-law carried by a vote of 45 to 0. The company will spend $500 in putting the plant in good order.

Port Arthur, Ont.—The extension to the waterworks system will be completed

about July 15. The work, which has been in progress about two years, represents an outlay of $550,000. The pumps have been supplied by Escher Wyss & Co., Montreal.

Redcliff, Alta.—Two by-laws voted on by the ratepayers on May 18, passed by substantial majorities. One by-law was for raising $75,000 for extending the waterworks system and the other was for raising $15,000 for installing additional street lights.

Eburne, B.C.—A by-law to authorize the Richmond Council to raise $40,000 for the extension of the municipal water service to the outlying districts is being prepared, and is expected to come before the council for consideration at the next regular meeting.

Galt, Ont.—The ratepayers of Galt on May 28 authorized a loan of $12,000 to the Maple Leaf Bedding Co., a by-law for this purpose receiving 558 votes in favor, and only 84 being polled against. The contractors will start at once on the erection of a building, and the firm expects to be ready to meet the demands of the fall trade.

Medicine Hat, Alta.—The by-law providing for the raising of $70,000 for the construction of a traffic subway under the C.P.R. tracks at High street, was defeated on May 27, by a vote of 263 to 94. Lack of interest is assigned as the cause of the rejection of the measure the vote cast being only about 15 per cent. of the total registration.

Lulu Island, B.C.—Richmond voters will probably be asked by the council this month to approve of a $40,000 water extension by-law. The by-law is in course of preparation at present and will be considered at the next regular council meeting. Up to the present time, extensions to the water system have been made out of current revenue, the whole municipality thus sharing the cost. In the future, according to the council's plans, they will be made out of this by-law.

Chatham, Ont.—The industrial committee of the City Council is at present considering a novel offer that has been made by P. S. Coate, manager of the Chatham Gas Co., for the sale of gas and electric plants to the city. The matter will, in all probability, come up for final disposal at the meeting next Monday. The company plans to pay for their own plant by placing the profits from year to year in a separate fund and, when this has reached $300,000, hand over the properties to the corporation.

Berlin, Ont.—The light commission has received information from Petrolea that it will be impossible to provide this city with natural gas, as was predicted several weeks ago. Three new wells recently drilled have run dry and the fourth has only a small flow. The commission had placed an order for a large 350,000 ft. gas holder, but when information that natural gas would be available the order was held in abeyance. The commission will now probably proceed with the proposed extensions to the artificial gas plant, to cost about $60,000.

Regina, Sask.—A civic manufacturers' building is being advocated by the Industrial Commissioner as a solution of the problem which is confronted by small concerns starting in business in this city. The proposal is to erect the building and to lease it out in sections to new industries for a period of from one to five years, the rental to be sufficient to cover the interest on the city's investment. It is suggested that the new building might be built of reinforced concrete, six storeys high, at a cost of approximately $100,000 and covering an area of probably 50 by 100 feet. This would make provision for the construction of twelve sections, each 50 by 50 feet, to accommodate twelve small concerns during the period they are building up a business, and until such time as they are in a position to finance their own buildings.

Orillia, Ont.—At a special meeting of the town council held recently, the Water, Light and Power Commission requested the council to raise by debenture the sum of $85,000 for waterworks improvements and extensions. The council decided to submit the matter to the people who will vote on a by-law, on Thursday, June 18. An estimate of the proposed expenditure is made up as follows: 24-inch intake pipe, $2,500; dosing tank and pump-house, $13,000; pumping machinery and piping, $22,075; mechanical filtration plant, $22,800; extension gravity main for spring water, $400; new concrete roof on storage well, $400; 16-inch force main, pumphouse to corner Canice street, $3,475; two electric hydraulic valves at reservoir, $630; additional valves and boxes, $1,500; meters for commercial services, $1,500; a quantity of 4-inch, 6-inch, 8-inch, and 10-inch, cast iron pipe, $16,700.

Electrical

London, Ont.—The Keystone Mattress Co. are in the market for a number of electric motors.

Forest, Ont.—The new hydro-electric system which was installed at a cost of $31,000, is now in operation.

Regina, Sask.—An expenditure of $81,457 has been authorized for this year's extensions to the distributing system of the electric light plant. Wire, poles, insulators, transformers, etc., will be required.

London, Ont. — The Hydro-Electric Power Commission has decided to construct a power line to serve Strathroy from the Hamilton road transformer to Lambeth, Delaware, Mount Brydges and to its termination.

Winnipeg, Man.—Winnipeg Electric Railway Co. will supply electrical energy to the municipality of Fort Garry, a motion having carried at the meeting of the Fort Garry council, ratifying by-law 161, authorizing the contract entered into between Fort Garry council and the Winnipeg Electric Railway Co. The price to be paid by the municipality is $100 a month.

General Industrial

Beachville, Ont.—Wm. Neilson & Co., of Toronto, will build a condensing factory here.

Dutton, Ont.—The flour mill owned by William Hollingshead was badly damaged by fire on May 27.

Listowel, Ont.—J. C. Hay & Son's tile plant was damaged by fire on May 31, to the extent of about $5,600, half of this amount being covered by insurance.

Port Coquitlam, B.C.—By a majority of 86, the by-law authorizing the council to raise the sum of $100,000 for road improvements, was passed upon by the ratepayers recently.

Eyebrow, Sask.—The elevator of the Western Elevator Co., here was completely destroyed by fire on May 27. More than 15,000 bushels of grain were destroyed. The loss is estimated at $23,000.

Medicine Hat, Alta.—W. N. McNeely has confirmed reports that the Lake of the Woods Milling Co. had purchased the Medicine Hat Milling plant and business. The sum paid is in the neighborhood of $300,000.

Ingersoll, Ont. — Heavy damage was caused by fire at the City Flour Mills on May 24. The whole building was swept by the flames, and the damage has been estimated at $25,000, which belongs largely to machinery.

Grimsby, Ont.—The Grimsby Specialty Co., capitalized at $50,000, has taken over the business of the Silica Soap Co. of Vancouver, and will move the plant to Grimsby. The company will make various kinds of soap.

Amherstburg, Ont.—The Solvay Process Co., Syracuse, N.Y., will erect a large plant here for the manufacture of soda ash and kindred commodities. It has taken an option on several acres, part of which will be used for a manufacturing site.

High Bluff, Alta.—A. Forsythe & Co. have started to rebuild their elevator which was recently destroyed by fire. Excavation is already well under way. The new elevator will be considerably larger than the old one, and will be up to the full standard.

Strathroy, Ont.—Hamilton, Ont., capitalists have leased some 4,000 acres of land a few miles north of here, near the village of Adelaide, and will commence oil and gas drilling operations immediately. According to all indications, the field promises to be a good one.

Medicine Hat, Alta.—The contract for the erection of a million-dollar mill for the Maple Leaf Milling Co. has been awarded to Archibald of Winnipeg, who built the Kenora mill for the firm. Work will commence immediately. Mr. Archibald is already on the ground and expects to have the mill ready for grinding by the new year.

Fort William, Ont.—The N. M. Paterson Grain and Elevator Co. of this city have purchased thirteen grain elevators throughout Saskatchewan. The elevators purchased were formerly owned by the Royal Elevator Co. of Winnipeg. The new line of elevators purchased will be operated in conjunction with and provide feeders for, the terminal elevator in this city, owned and operated by the Paterson Co.

Medicine Hat, Alta.—The Ogilvie Milling Co. has purchased elevators at Irvine, Bow Island, Stirling, Warner, Magrath and Monarch, all in Alberta. The company will build one at Wilson's Siding, ten miles south of Lethbridge, and three on the Suffield branch of the C. P. R. These ten elevators will bring the Ogilvie Co.'s number up to twenty-seven, with a total storage capacity outside of the mill elevator here, of 825,000 bushels.

Brampton, Ont.—Three by-laws were carried on June 1 by the electorate. The Copeland-Chatterson Co. of Toronto asked for exemption of taxes for ten years in consideration of removing its office and staff to this town and adding to its factory here. Lindner's, Ltd., a jam factory operating in Toronto, and anxious to locate in Brampton, stipulated that the town should guarantee the company's bonds for $20,000. The Imperial Steel Co. also asked for and secured like consideration. The vote polled showed a good deal of interest on the part of the citizens.

Waterloo, Ont.—The Doering Trunk Co., Ltd., which was established here four years ago, and which has built up an extensive business, requires larger quarters. They propose to close an option on the former factory of the Wardell-Green Co., and will ask the town for a loan of $15,000 for fifteen years at debenture rate of interest and exemption from taxation for a period of ten years. The loan is to be repaid in fifteen equal annual instalments. The town as security is to obtain a first mortgage on the buildings, land and machinery. The company would employ from 50 to 75 hands.

Ottawa, Ont.—Work has commenced on the Government transfer elevator at Port Nelson. Plans for this elevator were made by the Canadian Stewart Co. The grain company has handed over to the Department of Railways and Canals the construction of the foundations and has the work now under way. It is thought that in so doing greater progress could be made. Part of the material necessary for the work was sent in last year, and the first boats for the bay this season will take in enough for the year's work. As soon as the foundations are completed, the grain company will arrange for the construction of the superstructure.

Brantford, Ont.—The United Rubber Manufacturing and Redeeming Co. will commence operations early in the fall, employing 100 hands. A contract has been let for the remodeling of the old Farmers' Binder Twine Co. factory adjacent to the Grand Trunk tracks on Sydenham Street. The contract was let to Bennett & Bowden, and work will be immediately proceeded with. The rubber company, which owns the factory building, will commence manufacturing and reclaiming rubber early in the fall. The factory site with excellent railway facilities is considered one of the best in the city.

Personal

E. G. Jackson has resigned his position as sales manager of the Canadian Car and Foundry Co., the Canadian Steel Foundries, Ltd., and the Pratt & Letchworth Co., to enter into business on his own account .

G. H. Flood, agent of the Department of Marine and Fisheries, has been appointed purchasing agent of the Department at Ottawa, in place of Cecil Doutre, and John C. Chesley, chief clerk in the assessors' office, has been appointed agent at St. John, in succession to Mr. Flood.

Trade Gossip

The Turbine Equipment Co., Ltd., Toronto, Ont., has been awarded a contract for a De Laval centrifugal pump by the City of Stratford, Ont. The pump will have a capacity of 1,000 gallons per minute against a head of 200 feet.

The Herbert Morris Crane and Hoist Co., Ltd., Toronto, have received an order, through their Vancouver agents, Messrs. Waddy & Young, for a 10-ton hand-operated overhead traveling crane, fitted with "Morris" roller bearings to the main traveling motion.

Saskatchewan Engineers.—Efforts are being made by several power plant superintendents in Saskatchewan to form a local branch at Regina of the American Institute of Electrical Engineers. No definite action in the matter has been taken up to the present time.

Canadian Vickers Drydock.—The Lady Grey, one of the Government icebreakers which has been in the Canadian Vickers drydock for some time, was floated again on May 25. She has had a number of damaged plates on her bottom and bow renewed, as well as being generally overhauled. The Vickers drydock since the opening of navigation has undocked the Murray Bay, which spent the winter in the dock; docked and repaired the Saturnia, J. H. Plummer, and Lady Grey.

Wood Working

Niagara Falls, Ont.—The Dominion Chair Co., Toronto, has secured a site and will erect a factory here. The plant and equipment will cost about $185,000.

Limoilou, Que.—The box factory of the Turner Lumber & Pulp Co. was recently destroyed by fire, with a loss estimated at $20,000. It will be rebuilt at once.

New Westminster, B.C.—Fire recently destroyed the lumber and shingle mill of the Royal Shingle & Lumber Co., near the Lulu Island bridge. The damage is estimated at $8,000, part of which is covered by insurance.

Vancouver, B.C.—A large shingle mill is being built at Farney Bay, Vancouver Island. It is reported that several mills are projected near Vancouver on account of the reduction in the tariff on this product entering the United States.

Refrigeration

Bird's Hill, Man.—The municipality of St. Paul contemplate erecting a cold storage plant for vegetables and similar produce.

ASSOCIATION AND PERSONAL

A Weekly Record of Current Association News and of Individuals
Who Have Been More or Less Prominent in Machinery Circles

Personal

Frederic Nicolls, president of the Canadian General Electric Co., Ltd., was in Montreal recently attending the meeting of the Dominion Steel Corporation.

Victor Pezzini, representing the Victor Saw Co. of Springfield, Mass., and Hamilton, Ont., called on the Winnipeg trade last week, and proceeded west to the Coast.

F. F. Barber, who is in charge of the machine tool sales department of the Canadian Fairbanks-Morse Co., Toronto, was married on June 3 to Miss E. W. Walker, of Toronto.

G. B. Hunter, of the Tyne shipbuilding firm of Swan, Hunter, Wingham, Richardson & Co., arrived in Montreal on May 27, and will confer with Mr. Clarence De Sola, the Canadian director of the company.

C. L. Howse, of the Hamilton hydro system, has been appointed manager of public utilities for the city of Peterborough, Ont., at a salary of $2,400. Mr. Howse will have charge of the hydro system and waterworks.

Leonard Andrews, M.I.C.E., managing director of the Canadian British Engineering Co., Ltd., has taken over the management of the company's office in Winnipeg, Man., in succession to Mr. Reginald Porter, who has returned to London, England, to take charge of the office there.

Charles Herman, inventor of the pneumatic jarring molding machine that bears his name, died at his residence in Zelienople, Pa., aged 70 years. He also developed many other valuable patents known in the hardware and machinery trade. He was vice-president of the Herman Pneumatic Machine Company, Zelienople, and was born in Germany.

Charles G. Ritter, assistant superintendent of the Lunkenheimer Co., Cincinnati, Ohio, died at his residence in that city, May 23, after an illness of several months, aged 54 years. He had been with the company 22 years. In machine-tool circles he had an almost national reputation as a master tool maker. His brother Henry is superintendent of the Lunkenheimer Company.

D. H. Mapes, for the past two years connected with the C.P.R., but engaged for twenty-two years in building construction work, and formerly vice-president of the J. V. Schafer, Jr., Co., of New York City, one of the large construction firms on this continent, has been appointed superintendent of C.P.R. building construction. He succeeds F. L. Ellingwood, resigned.

W. Furniss Clarke, superintendent of Armstrong-Whitworth of Canada, Ltd., has returned to Montreal after paying a three months' visit to the various plants of the parent company in England, where he found business very good, if not quite so brisk as last year. Sir W. G. Armstrong-Whitworth & Co. in 1913 led the shipbuilding companies of the world with an output of 99,000 tons of all classes of boats. At present they have nineteen vessels on hand, six of these being battleships. Four of the latter are of the super-Dreadnought type. The Canadian plant at Longueuil, Que., is rapidly nearing completion, and is expected to go into operation at the beginning of August.

WHO'S WHO.

CAPTAIN W. J. PRESS.
Chief Mechanical Engineer, N.T.R., Ottawa, Ont.

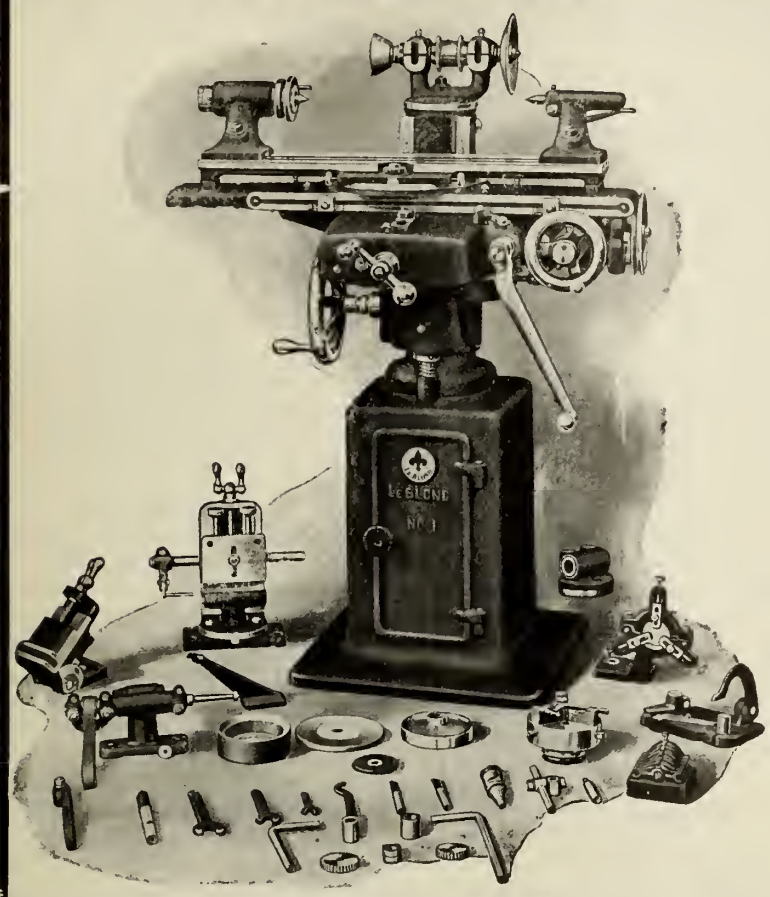
Trade Gossip

The Schuchardt & Schutte Co. have moved their head office for Canada from Montreal to 42 Adelaide Street West, Toronto.

The Escher Wyss Co., Montreal, have been awarded the contract for one 1,400 h.p. water wheel, with governor, relief valve, blow-off valve and accessories, by the corporation of Revelstoke, B.C.

The British Columbia Manufacturers' Association in Vancouver, B.C., are calling upon the Burrard Inlet Tunnel and Bridge Co. to have all the steel for the proposed Second Narrows bridge fabricated locally.

The Turbine Equipment Co., Ltd., Toronto, have sold a 600-gallon per minute De Laval two-stage centrifugal pump, operating against a pressure of 100 lbs. to the Coniagas Reduction Co., St. Catharines, Ont.



The Jones Underfeed Stoker Co., Ltd., Toronto, have been awarded a contract by the Standard Underground Cable Co., Hamilton, Ont., for four stokers to be installed with two 250-h.p. "Heine" water tube boilers.

The Escher Wyss & Co., Montreal, has been awarded a contract for a 6,000 k.w. turbo generator, by the Commissioners of Edmonton, Alta. The turbine is of the "Zoelly" Impulse type, and the alternator of Siemens make.

The Escher Wyss Co., Montreal, has been awarded a contract for one steam turbine driven centrifugal pump of 200 h. p. capacity, 1,500 r.p.m. by the B.C. Government, through Frank Darling & Co., Vancouver, their agents in British Columbia.

The Turbine Equipment Co., Ltd., Toronto, has sold to the Union Carbide Co., Welland, Ont., the following equipment: One 1,500 gallons per minute De Laval single stage centrifugal pump to operate against a pressure of 100 lbs., also one 850 gallons per minute De Laval single stage centrifugal pump to operate against a pressure of 75 lbs. Both these pumps will be motor driven.

Hall Engineering Works.—After having a number of her bow-plates riveted and another propeller fixed to replace the one damaged in her trip to Montreal from England, the Manchester Inventor has again sailed. Five hundred tons of grain was placed in her bow in order to raise the stern sufficiently to take off the smashed propeller and replace it with another, an operation which the Hall Engineering Works successfully accomplished. The Harbor Commissioners' floating crane was used to lift the propellers.

each of which weighed over seven tons originally, though the broken one was but a fraction of this weight. The vessel was repaired at her shed, the men working right through to a finish.

Two Lighters Launched. — A unique launching was successfully carried out on Saturday, May 30, at the Polson Ironworks, Toronto, when two lighters for the Hudson Bay Terminal slid into the water. Both lighters were built on the same set of ways, and the launching occupied the small space of eight minutes. The christening ceremonies were performed by Miss Meta Gibson, daughter of the Lieutenant-Governor of Ontario. The launching was attended by a distinguished gathering, who after the ceremony were the guests of Col. J. B. Miller, the president and general manager of the company, at a buffet luncheon. Among those present were: The Lieutenant-Governor, Sir J. M. Gibson, Prof. Cohoe, Mr. Sydney Fellows, Captain J. B. Foote of the Toronto Vessel and Insurance Agency; Mr. A. E. Mathews, of the Mathews Steamship Company; Chief Engineer Bowden, of the Dominion Department of Railways and Canals; Mr. J. C. Stewart, etc.

Catalogues

Electric Drills.—The "Thor" electric drills are fully described in circular E-1, just off the press, which is being distributed by the Independent Pneumatic Tool Co., Chicago, Ill. The circular contains specifications of the various sizes arranged in tabular form, and illustrations of several types, stating the work for which they are best suited. This attractive and well-arranged circular will be mailed to interested readers on request.

The Merry Moulder.—The April number of the house organ of the Osborn Mfg. Co., Cleveland, O., is, as usual, a bright little publication, containing several humorous stories with a moral, the book at the same time being an effective advertising medium. Other matter includes descriptions of some of the products made by the comptny, with illustrations and a few suggestions for foundrymen. A leaflet is inclosed, reseribing the "Osborn" vanadium steel shovel.

The Terry Steam Turbine Co., Hartford, Conn., have compiled a novelty in the form of a "vacation chart," which, at this time of the year, when holidays are being planned, will be very useful to office managers. The chart is arranged for the months of May to October, inclusive, and will be of great assistance when arranging vacations for the various members of the office staff, as the dates can be seen at a glance. Copies will be gladly mailed to managers or superintendents who have charge of such arrangements.

Sprague Electric Hoists.—The Canadian General Electric Co., are distributing an attractive Catalogue No. 905, dealing with the "Sprague" electric hoists. The catalogue runs to 31 pages, each containing an illustration of some particular type of electric hoist with a brief description. The illustrations serve to show the varied conditions under which the hoists can be operated as the majority of them are of installations. The catalogue concludes with tables giving the ratings, capacities and weights of the various sizes.

Brushes.—The Munning-Loeb Co., of Matawan, N.J., have just issued Bulletin 500, descriptive of their line of plating and industrial brushes. The book contains information on brush manufacture from the making of the block, selection and origin of stock to the final finish. Operating characteristics of the several brush materials and their adaptability to certain classes of work are briefly described. This book, which is fully illustrated, will be found a handy guide to the buyer in selecting the best and proper brush. It will be sent by writing to the Munning-Loeb Co.

Turbine Pumps.—Canadian Allis-Chalmers, Ltd., Toronto, have just issued an exceptionally interesting bulletin, No. 2001, dealing with the Mather & Platt type of turbine pumps which they make. A feature of the bulletin is the description of the pump testing plant at Rockfield, Que. The methods adopted in conducting the tests and description of the plant are given in detail, accompanied by illustrations. A full description is given of the Mather & Platt pump with cross sections showing the principal features of the design, and exterior views of several types, including many illustrations. The concluding pages contain much useful data on pipe friction and several characteristic curves for high-lift pumps.

Book Reviews

Fires in Lake Superior Iron Mines, is the title of technical paper No. 59, published by the Bureau of Mines, Department of the Interior, Washington, D.C. The bulletin is edited by Edwin Higgins and deals with the mining methods of the Lake Superior ranges and fire prevention in those regions. The bulletin is also intended to awaken the operator to the ever-present danger of fire underground, and also gives a number of suggestions for fire-fighting appliances.

The Ford-Smith Machine Company

A Well-Ground Tool is the Biggest Possible Spur to Good Machine Work, High Speeds, and Big Cuts.

The condition of your regular machine shop tools has a lot to do with output, both quality and quantity.

Tool Grinder Service means a machine close at hand, equipped with a carefully trued emery wheel of the proper grade, plenty of Belt Power and a water supply capable of instant adjustment from a drop to a flood.

Such conditions will do wonders toward getting output, and can be attained by a careful distribution of Ford-Smith Grinders wherever tool grinder service is required. We build with 12" up to 36", wheels capable of taking care of all tools up to the largest used in railroad and similar shops.

It will prove a remunerative proposition to study your facilities in this regard in your shop.

Write for our latest Grinder catalogue, which goes into the mail on receipt of your name and address.

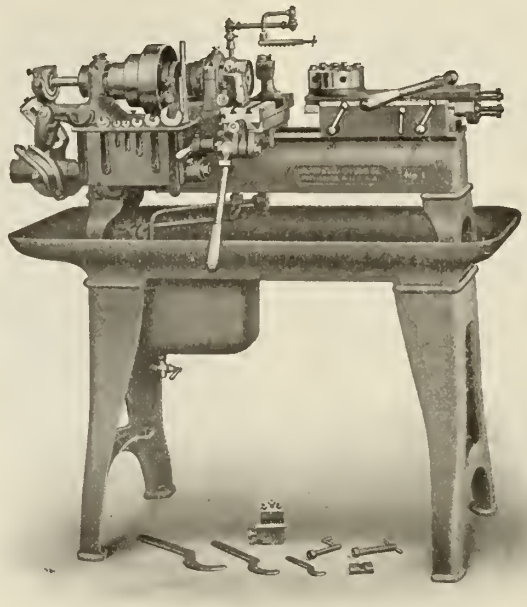
Canadian Blaugas Co., Limited

Dept. A. 304 E. T. Bank Bldg.



MONTREAL, P.Q.

Welding rails of Tramway System by Oxy-Acetylene process. Ask for details.

L'Air Liquide Society

MONTREAL Maisonneuve | TORONTO Boler St. | WINNIPEG William Ave.

You get fast production because —

The operator has full control in two levers that he can manipulate quickly.

Handy control, due to semi-automatic design, is a feature of

B. & S. Wire Feed Screw Machines

The lever shown at the upper right-hand side of machine controls movement of turret slide. Turret revolves automatically to bring each consecutive tool into position, and an automatic lock firmly secures turret when turret slide is advanced.

The large lever extending down from cross slide operates forming and cutting-off tools. A dog on cross slide trips chuck and wire feed mechanism as piece is cut off, causing new length to be fed.

If interested ask us for further information about Nos. 0 and 1 Wire Feed Screw Machines. Special circulars on request.
